03810
03811         A random number generator that generates random WORDs with a very
03812         long sequence. It is based on the Knuth generator.
03813
03814         We take some care that each thread can run its own, but each
03815         uses its own startup. Hence the seed includes the identity of
03816         the thread.
03817
03818         For NPAIR1, NPAIR2 we can use any pair from the table on page 28.
03819         Candidates are 24,55 (the example on the pages 171,172)
03820         or (33,97) or (38,89)
03821         These values are defined in fsizes.h and used in startup.c and threads.c

00041
00042 /*
00043     #] Includes :
```

```
00044     #[ Reshuf :
00045
00046     Routines to rearrange dummy indices, so that
00047     a:  The notation becomes reasonably unique (the perfect job
00048         may consume very much time).
00049     b:  The value of AR.CurDum is reset.
00050
00051     Also some routines are needed to aid in the reading of stored
00052     expressions. Also in those expressions there can be dummy
00053     indices, and there should be no conflict with the already
00054     existing dummies.
00055
00056         #[ ReNumber :
00057
00058         Reads the term, tests for dummies, and puts them in order.
00059         Note that this is kind of a first order approximation.
00060         There is quite some room to make this routine 'smart'
00061         First order:
00062             First index will be lowest, second will be next etc.
00063         Second order:
00064             Functions with more than one index and symmetry properties
00065             have some look ahead to see which index is the first to
00066             find its partner.
00067         Third order:
00068             Take the ordering of the functions into account.
00069         Fourth order:
00070             Try all permutations and see which one gives the 'minimal' term.
00071         Currently we use only the first order.
00072
00073         We need a scratch array for the numbers we find, and one for
00074         the addresses at which these numbers are.
00075         We can use the space for the Scrat arrays. There are 13 of those
00076         and each is AM.MaxTal UWORDs long.

01173 /*
01174     t points at the distrib_ function to be expanded.
```

```
01175     fun1,fun2 and typ1,typ2 are the two functions and their types.
01176     ntype indicates the action:
01177         0:  Make all possible divisions:  2^nargs
01178         1:  fun1 should get n arguments:  nargs! / ( n! (nargs-n)! )
01179         2:  fun2 should get n arguments:  nargs! / ( n! (nargs-n)! )
01180     The distinction between 1 and two is for noncommuting objects.
01181         3:  fun1 should get n arguments. Super symmetric option.
01182         4:  fun2 idem
01183     The super symmetric option involves:
01184         a:  arguments get sorted
01185         b:  identical arguments are seen as such. Hence not all their
01186             distributions are taken into account. It is as if after the
01187             distrib there is a symmetrize fun1; symmetrize fun2;
01188         c:  Hence if the occurrence of each argument is a,b,c,...
01189             and their occurrence in fun1 is a1,b1,c1,... and in fun2
01190             is a2,b2,c2,... then each term is generated (a1+a2)!/a1!/a2!
01191             (b1+b2)!/b1!/b2! (c1+c2)!/c1!/c2! ... times.
01192         d:  We have to make an array of occurrences and positions.
01193         e:  Then we sort the arguments indirectly.
01194         f:  Next we generate the argument lists in the same way as we
01195             generate powers of expressions with binomials. Hence we need
01196             a third array to keep track of the `powers'

01591         #] DoDelta3 :
01592         #[ TestPartitions :
01593
01594         Checks whether the function in tfun is a partitions_ function
01595         that can be expanded. If it can a number of relevant objects is
01596         inside the struct parti.
01597         This test is not entirely trivial because there are many restrictions
01598         w.r.t. the arguments.
01599         Syntax (still to be implemented)
01600         partitions_(number_of_partition_entries,[function,number,]^nope,arguments)
01601         [function,number,]: can be
01602             f,3     for a partition of 3 arguments
01603             f,0     for the remaining arguments (should be last)
01604             num1,f,num2 with num1 effectively a number of partitions but this
01605                     counts as num1 entries.
01606             0,f,num2: all partitions have num2 arguments. No number of partition
01607                     entries needed. If num2 does not divide the number of
01608                     arguments there will be no action.
01609 */

01789     Now comes the part where we have to make sure that
01790     a: we generate all partitions.
01791     b: we generate only different partitions.
01792     c: we get the proper combinatorics factor.
01793     Method:
01794     Suppose the largest partition needs n objects and there are m partitions.
01795     We allocate m arrays of n 'digits'. Make in the smaller partitions the
01796     appropriate leading digits zero.
01797     Divide the largest numbers (of the arguments) over the partitions as
01798     leftmost digits (after possible zeroes). The arrays, seen as numbers,
01799     should be such that each is less or equal to its left neighbour. Take the
01800     next largest numbers, etc. This generates unique partitions and all of
01801     them. Because we have a formula for the multiplicity, this should do it.
01802
01803     The general case. At a later stage we might put in a more economical
01804     version for special cases.

02200     #[ Shuffle :
02201
02202     How to make shuffles:
02203
02204     We have two lists of arguments. We have to make a single
02205     shuffle of them. All combinations. Doubles should have as
02206     much as possible a combinatorics factor. Sometimes this is
02207     very difficult as in:
02208         (0,1,2)x(0,1,3) -> (0,1) is a repeated pattern and the
02209         factor on that is difficult
02210     Simple way: (without combinatorics)
02211         repeat id  f0(?c)*f(x1?,?a)*f(x2?,?b) =
02212                         +f0(?c,x1)*f(?a)*f(x2,?b)
02213                         +f0(?c,x2)*f(x1,?a)*f(?b);
02214     Refinement:
02215             if ( x1 == x2 ) check how many more there are of the same.
02216             --> (n1,x) and (n2,x)
```

```
02217             id  f0(?c)*f1((n1,x),?b)*f2((n2,x),?c) =
02218                     +binom_(n1+n2,n1)*f0(?c,(n1+n2,x))*f1(?a)*f2(?b)
02219                     +sum_(j,0,n1-1,binom_(n2+j,j)*f0(?c,(j+n2,x))
02220                             *f1((n1-j),?a)*f2(?b))*force2
02221                     +sum_(j,0,n2-1,binom_(n1+j,j)*f0(?c,(j+n1,x))
02222                             *f1(?a)*f2((n2-j),?b))*force1
02223     The force operation can be executed directly
02224
02225     The next question is how to program this: recursively or linearly
02226     which would require simulation of a recursion. Recursive is clearest
02227     but we need to pass a number of arguments from the calling routine
02228     to the final routine. This is done with AN.SHvar.
02229
02230     We need space for the accumulation of the combinatoric factors.

02476
02477     Stuffling is a variation of shuffling.
```

```
02478     In the stuffling we insist that the arguments are (short) integers. nonzero.
02479     The stuffle sum is x st y = sig_(x)*sig_(y)*(abs(x)+abs(y))
02480     The way we do this is:
02481         1: count the arguments in each function: n1, n2
02482         2: take the minimum minval = min(n1,n2).
02483         3: for ( j = 0; j <= min; j++ ) take j elements in each of the lists.
02484         4: the j+1 groups of remaining arguments have to each be shuffled
02485         5: the j selected pairs have to be stuffle added.
02486     We can use many of the shuffle things.
02487     Considering the recursive nature of the generation we actually don't
02488     need to know n1, n2, minval.

4.125.1 Detailed Description

Contains the functions that deal with the writing of expressions/terms in a textual representation. (Dutch schrijven = to write)

Definition in file sch.c.

4.125.2 Function Documentation

4.125.2.1 StrCopy()

```
UBYTE * StrCopy (
            UBYTE * from,
            UBYTE * to )
```

Definition at line 49 of file sch.c.

4.125.2.2 AddToLine()

```
void AddToLine (
            UBYTE * s )
```

Definition at line 64 of file sch.c.

4.125.2.3 FiniLine()

```
void FiniLine (
            void  )
```

Definition at line 164 of file sch.c.

4.125.2.4 IniLine()

```
void IniLine (
             WORD extrablank )
```

Definition at line 249 of file sch.c.

4.125.2.5 LongToLine()

```
void LongToLine (
             UWORD * a,
             WORD na )
```

Definition at line 285 of file sch.c.

4.125.2.6 RatToLine()

```
void RatToLine (
             UWORD * a,
             WORD na )
```

Definition at line 319 of file sch.c.

4.125.2.7 TalToLine()

```
void TalToLine (
             UWORD x )
```

Definition at line 504 of file sch.c.

4.125.2.8 TokenToLine()

```
void TokenToLine (
             UBYTE * s )
```

Definition at line 533 of file sch.c.

4.125.2.9 CodeToLine()

```
UBYTE * CodeToLine (
             WORD number,
             UBYTE * Out )
```

Definition at line 640 of file sch.c.

4.125.2.10 MultiplyToLine()

```
void MultiplyToLine (
            void  )
```

Definition at line 653 of file sch.c.

4.125.2.11 AddArrayIndex()

```
UBYTE * AddArrayIndex (
            WORD num,
            UBYTE * out )
```

Definition at line 678 of file sch.c.

4.125.2.12 PrtTerms()

```
void PrtTerms (
            void  )
```

Definition at line 698 of file sch.c.

4.125.2.13 WrtPower()

```
UBYTE * WrtPower (
            UBYTE * Out,
            WORD Power )
```

Definition at line 720 of file sch.c.

4.125.2.14 PrintTime()

```
void PrintTime (
            UBYTE * mess )
```

Definition at line 766 of file sch.c.

4.125.2.15 WriteLists()

```
void WriteLists (
            void  )
```

Definition at line 792 of file sch.c.

4.125.2.16 WriteDictionary()

```
void WriteDictionary (
            DICTIONARY * dict )
```

Definition at line 1289 of file sch.c.

4.125.2.17 WriteArgument()

```
void WriteArgument (
             WORD * t )
```

Definition at line 1406 of file sch.c.

4.125.2.18 WriteSubTerm()

```
int WriteSubTerm (
             WORD * sterm,
             WORD first )
```

Definition at line 1526 of file sch.c.

4.125.2.19 WriteInnerTerm()

```
int WriteInnerTerm (
             WORD * term,
             WORD first )
```

Definition at line 1937 of file sch.c.

4.125.2.20 WriteTerm()

```
int WriteTerm (
             WORD * term,
             WORD * lbrac,
             WORD first,
             WORD prtf,
             WORD br )
```

Definition at line 2137 of file sch.c.

4.125.2.21 WriteExpression()

```
int WriteExpression (
             WORD * terms,
             LONG ltot )
```

Definition at line 2459 of file sch.c.

4.125.2.22 WriteAll()

```
int WriteAll (
             void  )
```

Definition at line 2490 of file sch.c.

4.125.2.23 WriteOne()

```
int WriteOne (
              UBYTE * name,
              int alreadyinline,
              int nosemi,
              WORD plus )
```

Definition at line 2716 of file sch.c.

4.126 sch.c

4.127.1 Detailed Description

The routines that deal with the setup parameters.

Definition in file setfile.c.

4.127.2 Macro Definition Documentation

4.127.2.1 NUMERICALVALUE

```
#define NUMERICALVALUE 0
```

Definition at line 47 of file setfile.c.

4.127.2.2 STRINGVALUE

```
#define STRINGVALUE 1
```

Definition at line 48 of file setfile.c.

4.127.2.3 PATHVALUE

```
#define PATHVALUE 2
```

Definition at line 49 of file setfile.c.

4.127.2.4 ONOFFVALUE

```
#define ONOFFVALUE 3
```

Definition at line 50 of file setfile.c.

4.127.2.5 DEFINEVALUE

```
#define DEFINEVALUE 4
```

Definition at line 51 of file setfile.c.

4.127.2.6 SETBUFSIZE

```
#define SETBUFSIZE 257
```

Definition at line 1167 of file setfile.c.

4.127.3 Function Documentation

4.127.3.1 DoSetups()

```
int DoSetups (
            void  )
```

Definition at line 133 of file setfile.c.

4.127.3.2 ProcessOption()

```
int ProcessOption (
            UBYTE * s1,
            UBYTE * s2,
            int filetype )
```

Definition at line 183 of file setfile.c.

4.127.3.3 GetSetupPar()

```
SETUPPARAMETERS * GetSetupPar (
            UBYTE * s )
```

Definition at line 338 of file setfile.c.

4.127.3.4 RecalcSetups()

```
int RecalcSetups (
            void  )
```

Definition at line 359 of file setfile.c.

4.127.3.5 AllocSetups()

```
int AllocSetups (
            void  )
```

Definition at line 415 of file setfile.c.

4.127.3.6 WriteSetup()

```
void WriteSetup (
            void  )
```

Definition at line 812 of file setfile.c.

4.127.3.7 AllocSort()

```
SORTING * AllocSort (
            LONG inLargeSize,
            LONG inSmallSize,
            LONG inSmallEsize,
            LONG inTermsInSmall,
            int inMaxPatches,
            int inMaxFpatches,
            LONG inIOsize,
            int level )
```

Definition at line 870 of file setfile.c.

4.127.3.8 AllocSortFileName()

```
void AllocSortFileName (
            SORTING * sort )
```

Definition at line 1020 of file setfile.c.

4.127.3.9 AllocFileHandle()

```
FILEHANDLE * AllocFileHandle (
            WORD par,
            char * name )
```

Definition at line 1045 of file setfile.c.

4.127.3.10 DeAllocFileHandle()

```
void DeAllocFileHandle (
            FILEHANDLE * fh )
```

Definition at line 1106 of file setfile.c.

4.127.3.11 MakeSetupAllocs()

```
int MakeSetupAllocs (
            void  )
```

Definition at line 1123 of file setfile.c.

4.127.3.12 AllocNormData()

```
NORMDATA * AllocNormData (
            void  )
```

Definition at line 1137 of file setfile.c.

4.127.3.13 TryFileSetups()

```
int TryFileSetups (
            void  )
```

Definition at line 1169 of file setfile.c.

4.127.3.14 TryEnvironment()

```
int TryEnvironment (
            void  )
```

Definition at line 1258 of file setfile.c.

4.127.4 Variable Documentation

4.127.4.1 curdirp

```
char curdirp[] = "."
```

Definition at line 39 of file setfile.c.

4.127.4.2 cursortdirp

```
char cursortdirp[] = "."
```

Definition at line 40 of file setfile.c.

4.127.4.3 commentchar

```
char commentchar[] = "*"
```

Definition at line 41 of file setfile.c.

4.127.4.4 dotchar

```
char dotchar[] = "_"
```

Definition at line 42 of file setfile.c.

4.127.4.5 highfirst

```
char highfirst[] = "highfirst"
```

Definition at line 43 of file setfile.c.

4.127.4.6 lowfirst

```
char lowfirst[] = "lowfirst"
```

Definition at line 44 of file setfile.c.

4.127.4.7 procedureextension

```
char procedureextension[] = "prc"
```

Definition at line 45 of file setfile.c.

4.127.4.8 setupparameters

```
SETUPPARAMETERS setupparameters[]
```

Definition at line 53 of file setfile.c.

4.128 setfile.c

00798
00799     The routine writes the values of the setup parameters.
00800     We should do this better. (JV, 21-may-2008)
00801     The way it should be done is:
00802         a: write the raw values.
00803         b: give readjusted values.
00804         c: give derived values.
00805     Because this is a difficult subject, it would be nice to have a LaTeX
00806     document that explains this all exactly. There should then be a
00807     mechanism to poke the values of the setup into the LaTeX document.
```

```
00808     probably the easiest way is to make a file with lots of \def definitions
00809     and have that included into the LaTeX file.

- int MatchIsPossible (WORD *pattern, WORD *term)

4.129.1 Detailed Description

The functions for smart pattern searches in combinations of functions. When many wildcards are involved and the functions are (anti)symmetric an exhaustive search for all possibilities may take very much time (like factorial in the number of wildcards) while a human can often see immediately that there cannot be a match. The routines here try to make FORM a bit smarter in this respect.

This is just the beginning. It still needs lots of work!

4.131.1 Detailed Description

Contains the sort routines. We distinguish levels of sorting. The ground level is the sorting of terms in an expression. When a term has functions, the arguments can contain terms that need sorting, which this then done by raising the level. This can happen recursively. NewSort and EndSort automatically raise and lower the level. Because the ground level does some special things, sometimes we have to raise immediately to the second level skipping the ground level.

Special routines for the parallel sorting are in the file threads.c Also the sorting of terms in polynomials is special but most of that is controlled by changing the address of the compare routine. Other routines relevant for adding rational polynomials are in the file polynito.c

4.131.3 Function Documentation

4.131.3.1 HumanString()

```
void HumanString (
             char * string,
             float input,
             const float scale,
             const char suffix[HUMANSUFFLEN][HUMANSUFFSTRLEN] )
```

Definition at line 89 of file sort.c.

4.131.3.2 DigitsIn()

```
WORD DigitsIn (
             LONG x )
```

Definition at line 112 of file sort.c.

4.131.3.3 WriteStats()

```
void WriteStats (
             POSITION * plspace,
             WORD par,
             WORD checkLogType )
```

Writes the statistics.

Parameters

plspace	The size in bytes currently occupied
par	par = 0 = STATSSPLITMERGE after a splitmerge. par = 1 = STATSMERGETOFILE after merge to sortfile. par = 2 = STATSPOSTSORT after the sort
checkLogType	== CHECKLOGTYPE: The output should not go to the log file if AM.LogType is 1.

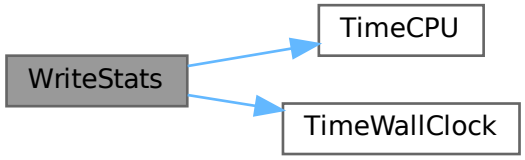
current expression is to be found in AR.CurExpr. terms are in S->TermsLeft. S->GenTerms.

Definition at line 138 of file sort.c.

References TimeCPU(), and TimeWallClock().

Referenced by EndSort(), PF_Processor(), and StoreTerm().

Here is the call graph for this function:



4.131.3.4 NewSort()

```
int NewSort (
            PHEAD0  )
```

Starts a new sort. At the lowest level this is a 'main sort' with the struct according to the parameters in S0. At higher levels this is a sort for functions, subroutines or dollars. We prepare the arrays and structs.

Returns

Regular convention (OK -> 0)

Definition at line 397 of file sort.c.

Referenced by generate_expression(), get_expression(), InFunction(), MakeDollarInteger(), MakeDollarMod(), PF_CollectModifiedDollars(), PF_Processor(), poly_factorize_expression(), poly_sort(), poly_unfactorize_expression(), PolyFunMul(), Processor(), TakeArgContent(), and TestMatch().

4.131.3.5 EndSort()

```
LONG EndSort (
              PHEAD WORD * buffer,
              int par )
```

Finishes a sort. At AR.sLevel == 0 the output is to the regular output stream. When AR.sLevel $>$ 0, the parameter par determines the actual output. The AR.sLevel will be popped. All ongoing stages are finished and if the sortfile is open it is closed. The statistics are printed when AR.sLevel == 0 par == 0 Output to the buffer. par == 1 Sort for function arguments. The output will be copied into the buffer. It is assumed that this is in the WorkSpace. par == 2 Sort for $-variable. We return the address of the buffer that contains the output in buffer (treated like WORD $**$). We first catch the output in a file (unless we can intercept things after the small buffer has been sorted) Then we read from the file into a buffer. Only when par == 0 data compression can be attempted at AT.SS==AT.S0.

Parameters

buffer	buffer for output when needed
par	See above

Returns

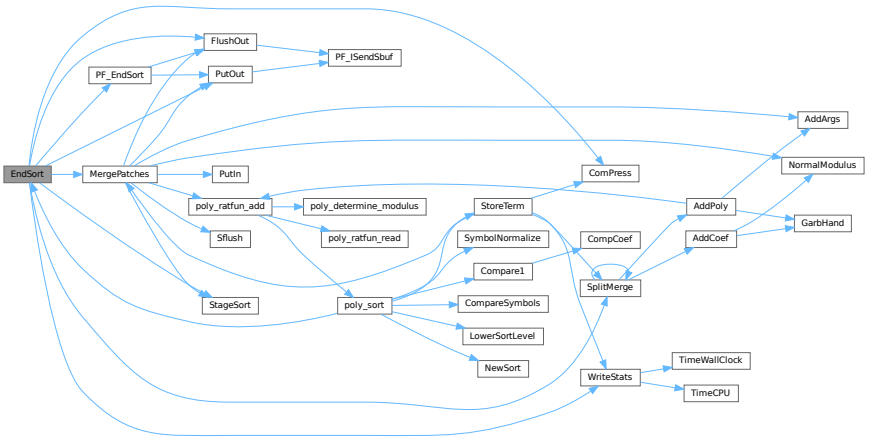
If negative: error. If positive: number of words in output.

Definition at line 488 of file sort.c.

References ComPress(), FlushOut(), MergePatches(), PF_EndSort(), PutOut(), SplitMerge(), StageSort(), and WriteStats().

Referenced by generate_expression(), get_expression(), InFunction(), MakeDollarInteger(), MakeDollarMod(), PF_CollectModifiedDollars(), PF_Processor(), poly_factorize_expression(), poly_sort(), poly_unfactorize_expression(), PolyFunMul(), Processor(), TakeArgContent(), and TestMatch().

Here is the call graph for this function:



4.131.3.6 PutIn()

```
LONG PutIn (
            FILEHANDLE * file,
            POSITION * position,
            WORD * buffer,
            WORD ** take,
            int npat )
```

Reads a new patch from position in file handle. It is put at buffer, anything after take is moved forward. This would be part of a term that hasn't been used yet. Because of this there should be some space before the start of the buffer

Parameters

file	The file system from which to read
position	The position from which to read
buffer	The buffer into which to read
take	The unused tail should be moved before the buffer
npat	The number of the patch. Is needed if the information was compressed with gzip, because each patch has its own independent gzip encoding.

Definition at line 1065 of file sort.c.

References FiLe::handle.

Referenced by MergePatches().

4.131.3.7 Sflush()

```
int Sflush (
            FILEHANDLE * fi )
```

Puts the contents of a buffer to output Only to be used when there is a single patch in the large buffer.

Parameters

fi	The filesystem (or its cache) to which the patch should be written

Definition at line 1131 of file sort.c.

References FiLe::handle.

Referenced by MergePatches().

4.131.3.8 PutOut()

```
WORD PutOut (
             PHEAD WORD * term,
             POSITION * position,
             FILEHANDLE * fi,
             WORD ncomp )
```

Routine writes one term to file handle at position. It returns the new value of the position.

NOTE: For 'final output' we may have to index the brackets. See the struct BRACKETINDEX. We should maintain: 1: a list with brackets array with the brackets 2: a list of objects of type BRACKETINDEX. It contains array with either pointers or offsets to the list of brackets. starting positions in the file. The index may be tied to a maximum size. In that case we may have to prune the list occasionally.

Parameters

term	The term to be written
position	The position in the file. Afterwards it is updated
fi	The file (or its cache) to which should be written
ncomp	Information about what type of compression should be used

Definition at line 1217 of file sort.c.

References FiLe::handle, and PF_ISendSbuf().

Referenced by EndSort(), generate_expression(), MergePatches(), PF_EndSort(), PF_Processor(), and Processor().

Here is the call graph for this function:

4.131.3.9 FlushOut()

```
int FlushOut (
              POSITION * position,
              FILEHANDLE * fi,
              int compr )
```

Completes output to an output file and writes the trailing zero.

Parameters

position	The position in the file after writing
fi	The file (or its cache)
compr	Indicates whether there should be compression with gzip.

Returns

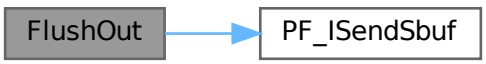
Regular conventions (OK -> 0).

Definition at line 1581 of file sort.c.

References FiLe::handle, BrAcKeTiNfO::indexbuffer, and PF_ISendSbuf().

Referenced by EndSort(), MergePatches(), PF_EndSort(), and Processor().

Here is the call graph for this function:



4.131.3.10 AddCoef()

```
int AddCoef (
              PHEAD WORD ** ps1,
              WORD ** ps2 )
```

Adds the coefficients of the terms ∗ps1 and ∗ps2. The problem comes when there is not enough space for a new longer coefficient. First a local solution is tried. If this is not successful we need to move terms around. The possibility of a garbage collection should not be ignored, as avoiding this costs very much extra space which is nearly wasted otherwise.

If the return value is zero the terms cancelled.

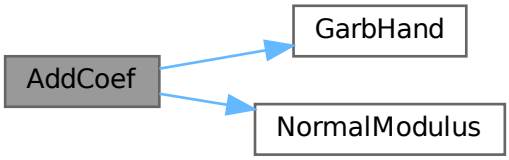
The resulting term is left in ∗ps1.

Definition at line 1795 of file sort.c.

References GarbHand(), and NormalModulus().

Referenced by SplitMerge().

Here is the call graph for this function:



4.131.3.11 AddPoly()

```
int AddPoly (
              PHEAD WORD ** ps1,
              WORD ** ps2 )
```

Routine should be called when S->PolyWise != 0. It points then to the position of AR.PolyFun in both terms.

We add the contents of the arguments of the two polynomials. Special attention has to be given to special arguments. We have to reserve a space equal to the size of one term + the size of the argument of the other. The addition has to be done in this routine because not all objects are reentrant.

Newer addition (12-nov-2007). The PolyFun can have two arguments. In that case S->PolyFlag is 2 and we have to call the routine for adding rational polynomials. We have to be rather careful what happens with: The location of the output The order of the terms in the arguments At first we allow only univariate polynomials in the PolyFun. This restriction will be lifted a.s.a.p.

Parameters

ps1	A pointer to the position of the first term
ps2	A pointer to the position of the second term

Returns

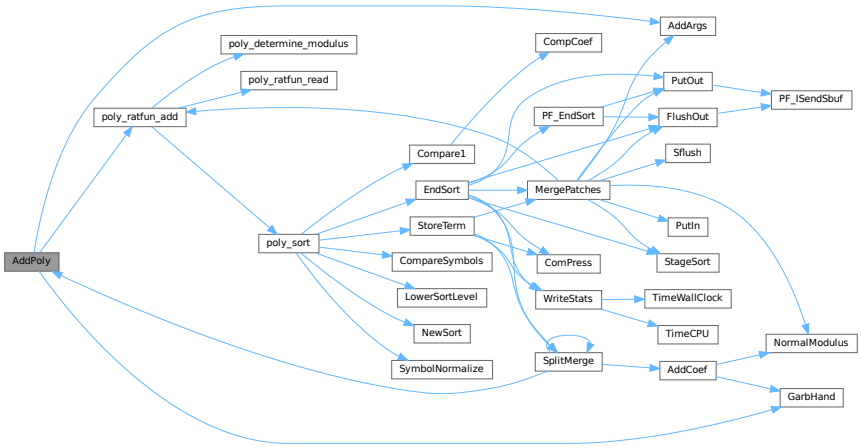
If zero the terms cancel. Otherwise the new term is in ∗ps1.

Definition at line 1925 of file sort.c.

References AddArgs(), GarbHand(), and poly_ratfun_add().

Referenced by SplitMerge().

Here is the call graph for this function:



4.131.3.12 AddArgs()

```
void AddArgs (
            PHEAD WORD * s1,
            WORD * s2,
            WORD * m )
```

Adds the arguments of two occurrences of the PolyFun.

Parameters

s1	Pointer to the first occurrence.
s2	Pointer to the second occurrence.
m	Pointer to where the answer should be.

Definition at line 2098 of file sort.c.

Referenced by AddPoly(), and MergePatches().

4.131.3.13 Compare1()

```
WORD Compare1 (
            PHEAD WORD * term1,
            WORD * term2,
            WORD level )
```

Compares two terms. The answer is: 0 equal (with exception of the coefficient if level == 0.) >0 term1 comes first. <0 term2 comes first. Some special precautions may be needed to keep the CompCoef routine from generating overflows, although this is very unlikely in subterms. This routine should not return an error condition.

Originally this routine was called Compare. With the treatment of special polynomials with terms that contain only symbols and the need for extreme speed for the polynomial routines we made a special compare routine and now we store the address of the current compare routine in AR.CompareRoutine and have a macro Compare which makes all existing code work properly and we can just replace the routine on a thread by thread basis (each thread has its own AR struct).

Parameters

term1	First input term
term2	Second input term
level	The sorting level (may influence on the result)

Returns

0 equal (with exception of the coefficient if level == 0.) >0 term1 comes first. <0 term2 comes first.

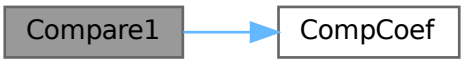
When there are floating point numbers active (float_ = FLOATFUN) the presence of one or more float_ functions is returned in AT.SortFloatMode: 0: no float_ 1: float_ in term1 only 2: float_ in term2 only 3: float_ in both terms

Definition at line 2393 of file sort.c.

References CompCoef().

Referenced by InFunction(), poly_sort(), and StartVariables().

Here is the call graph for this function:



4.131.3.14 CompareSymbols()

```
WORD CompareSymbols (
             PHEAD WORD * term1,
             WORD * term2,
             WORD par )
```

Compares the terms, based on the value of AN.polysortflag. If term1 < term2 the return value is -1 If term1 > term2 the return value is 1 If term1 = term2 the return value is 0 The coefficients may differ. The terms contain only a single subterm of type SYMBOL. If AN.polysortflag = 0 it is a 'regular' compare. If AN.polysortflag = 1 the sum of the powers is more important par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in sort.c

Definition at line 2856 of file sort.c.

Referenced by InFunction(), and poly_sort().

4.131.3.15 CompareHSymbols()

```
WORD CompareHSymbols (
             PHEAD WORD * term1,
             WORD * term2,
             WORD par )
```

Compares terms that can have only SYMBOL and HAAKJE subterms. If term1 < term2 the return value is -1 If term1 > term2 the return value is 1 If term1 = term2 the return value is 0 par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in sort.c

Definition at line 2906 of file sort.c.

4.131.3.16 ComPress()

```
LONG ComPress (
             WORD ** ss,
             LONG * n )
```

Gets a list of pointers to terms and compresses the terms. In n it collects the number of terms and the return value of the function is the space that is occupied.

We have to pay some special attention to the compression of terms with a PolyFun. This PolyFun should occur only straight before the coefficient, so we can use the same trick as for the coefficient to sabotage compression of this object (Replace in the history the function pointer by zero. This is safe, because terms that would be identical otherwise would have been added).

Parameters

ss	Array of pointers to terms to be compressed.
n	Number of pointers in ss.

Returns

Total number of words needed for the compressed result.

Definition at line 2959 of file sort.c.

Referenced by EndSort(), and StoreTerm().

4.131.3.17 SplitMerge()

```
LONG SplitMerge (
            PHEAD WORD ** Pointer,
            LONG number )
```

Algorithm by J.A.M.Vermaseren (31-7-1988)

Note that AN.SplitScratch and AN.InScratch are used also in GarbHand

Merge sort in memory. The input is an array of pointers. Sorting is done recursively by dividing the array in two equal parts and calling SplitMerge for each. When the parts are small enough we can do the compare and take the appropriate action. An addition is that we look for 'runs'. Sequences that are already ordered. This happens a lot when there is very little action in a module. This made FORM faster by a few percent.

Parameters

Pointer	The array of pointers to the terms to be sorted.
number	The number of pointers in Pointer.

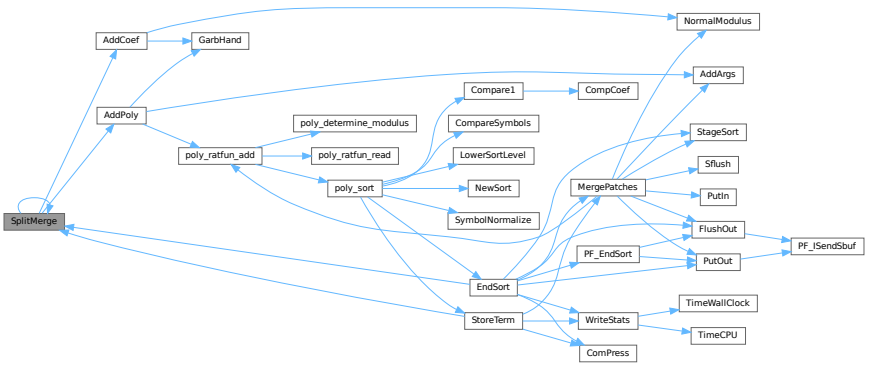
The terms are supposed to be sitting in the small buffer and there is supposed to be an extension to this buffer for when there are two terms that should be added and the result takes more space than each of the original terms. The notation guarantees that the result never needs more space than the sum of the spaces of the original terms.

Definition at line 3125 of file sort.c.

References AddCoef(), AddPoly(), and SplitMerge().

Referenced by EndSort(), SplitMerge(), and StoreTerm().

Here is the call graph for this function:



4.131.3.18 GarbHand()

```
void GarbHand (
            void  )
```

Garbage collection that takes place when the small extension is full and we need to place more terms there. When this is the case there are many holes in the small buffer and the whole can be compactified. The major complication is the buffer for SplitMerge. There are to options for temporary memory: 1: find some buffer that has enough space (maybe in the large buffer). 2: allocate a buffer. Give it back afterwards of course. If the small extension is properly dimensioned this routine should be called very rarely. Most of the time it will be called when the polyfun or polyratfun is active.

Definition at line 3405 of file sort.c.

Referenced by AddCoef(), and AddPoly().

4.131.3.19 MergePatches()

```
int MergePatches (
            WORD par )
```

The general merge routine. Can be used for the large buffer and the file merging. The array S->Patches tells where the patches start S->pStop tells where they end (has to be computed first). The end of a 'line to be merged' is indicated by a zero. If the end is reached without running into a zero or a term runs over the boundary of a patch it is a file merging operation and a new piece from the file is read in.

Parameters

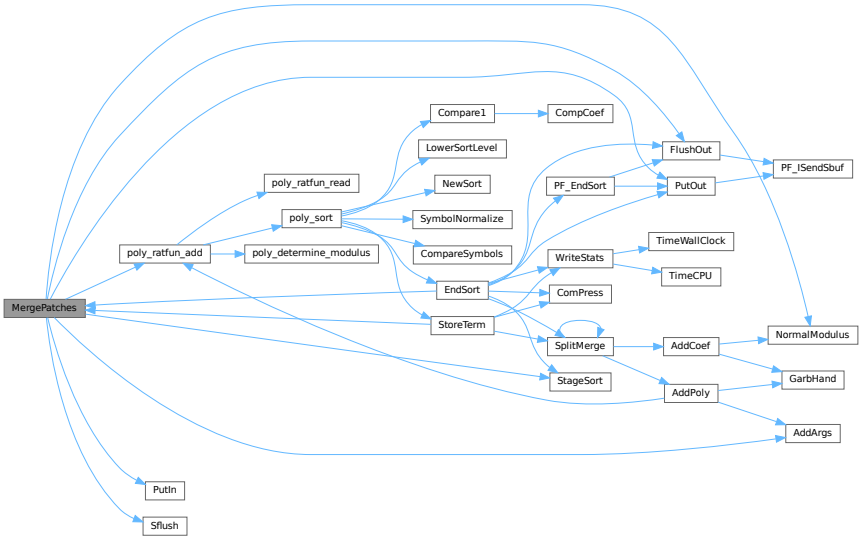
par	If par == 0 the sort is for file -> outputfile. If par == 1 the sort is for large buffer -> sortfile. If par == 2 the sort is for large buffer -> outputfile.

Definition at line 3520 of file sort.c.

References AddArgs(), FlushOut(), FiLe::handle, NormalModulus(), poly_ratfun_add(), PutIn(), PutOut(), Sflush(), and StageSort().

Referenced by EndSort(), and StoreTerm().

Here is the call graph for this function:



4.131.3.20 StoreTerm()

```
int StoreTerm (
            PHEAD WORD * term )
```

The central routine to accept terms, store them and keep things at least partially sorted. A call to EndSort will then complete storing and sorting.

Parameters

term	The term to be stored

Returns

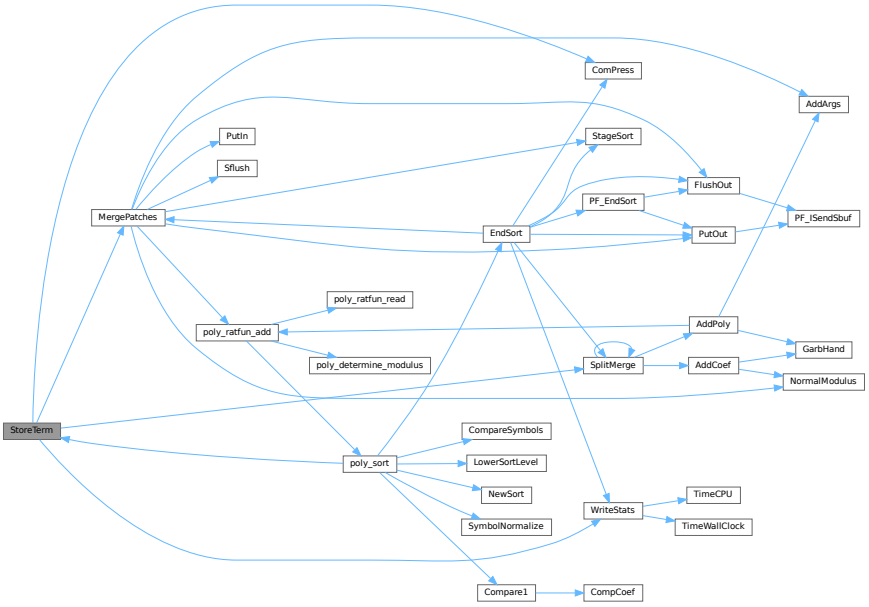
Regular return conventions (OK -> 0)

Definition at line 4311 of file sort.c.

References ComPress(), MergePatches(), SplitMerge(), and WriteStats().

Referenced by Generator(), get_expression(), InFunction(), PF_Processor(), poly_sort(), PolyFunMul(), Processor(), and TakeArgContent().

Here is the call graph for this function:



4.131.3.21 StageSort()

```
void StageSort (
            FILEHANDLE * fout )
```

Prepares a stage 4 or higher sort. Stage 4 sorts occur when the sort file contains more patches than can be merged in one pass.

Definition at line 4437 of file sort.c.

References FiLe::handle.

Referenced by EndSort(), and MergePatches().

4.131.3.22 SortWild()

```
int SortWild (
            WORD * w,
            WORD nw )
```

Sorts the wildcard entries in the parameter w. Double entries are removed. Full space taken is nw words. Routine serves for the reading of wildcards in the compiler. The entries come in the format: (type,4,number,0) in which the zero is reserved for the future replacement of 'number'.

Parameters

w	buffer with wildcard entries.
nw	number of wildcard entries.

Returns

Normal conventions (OK -> 0)

Definition at line 4536 of file sort.c.

4.131.3.23 CleanUpSort()

```
void CleanUpSort (
            int num )
```

Partially or completely frees function sort buffers.

Definition at line 4631 of file sort.c.

4.131.3.24 LowerSortLevel()

```
void LowerSortLevel (
            void  )
```

Lowers the level in the sort system.

Definition at line 4731 of file sort.c.

04445             There are no proper provisions for stage 4 or higher sorts
04446             for function arguments and $ variables. The reason:
04447             The current code maps out the patches, based on the size of
04448             the buffers in the FoStage4 structs, while they are used
04449             inside the S->file struct that may have far smaller buffers.
04450             By itself that might still be repairable, but it goes completely
04451             wrong when during the sort polyRatFuns have to be added and they
04452             would go into stage4 (very rare but possible).
04453             The only really correct solution would be to put FoStage4 structs
04454             in all sort levels. Messy. (JV 8-oct-2018).

00038 /*
00039     #] includes :
00040     #[ Commentary :
00041
00042     We use an array of SPECTATOR structs in AM.SpectatorFiles.
00043     When a spectator is removed this leaves a hole. This means that
00044     we cannot use AM.NumSpectatorFiles but always have to scan up to
00045     AM.SizeForSpectatorFiles which is the size of the array.
00046     An element is in use when it has a name. This is the name of the
00047     expression that is associated with it. There is also the number of
00048     the expression, but because the expressions are frequently renumbered
00049     at the end of a module, we always search for the spectators by name.
00050     The expression number is only valid in the current module.
00051     During execution we use the number of the spectator.
00052
00053     The FILEHANDLE struct is borrowed from the structs for the scratch
00054     files, but we do not keep copies for all workers as with the scratch
00055     files. This brings some limitations (but saves much space). Basically
00056     the reading can only be done by one master or worker. And because
00057     we use the buffer both for writing and for reading we cannot read and
00058     write in the same module.
00059
00060     Processor can see that an expression is to be filled with a spectator
00061     because we replace the compiler buffer number in the prototype by
00062     -specnum-1. Of course, after this filling has taken place we should
00063     make sure that in the next module there is a nonnegative number there.
00064     The input is then obtained from GetFromSpectator instead from GetTerm.
00065     This needed an extra argument in ThreadsProcessor. InParallelProcessor
00066     can figure it out by itself. ParFORM still needs to be treated for this.
00067
00068     The writing is to a single buffer. Hence it needs a lock. It is possible
00069     to give all workers their own buffers (at great memory cost) and merge
00070     the results when needed. That would be friendlier on ParFORM. We ALWAYS
00071     assume that the order of the terms in the spectator file is random.
00072
00073     In the first version there is no compression in the file. This could
00074     change in later versions because both the writing and the reading are
00075     purely sequential. Brackets are not possible.
00076
00077     Currently, ParFORM allows use of spectators only in the sequential
00078     mode. The parallelization is switched off in modules containing
00079     ToSpectator or CopySpectator. Workers never create or access to
00080     spectator files. Their file handles are always -1. We leave the
00081     parallelization of modules with spectators for future work.

```
int OpenInput (
             void  )
```

Definition at line 589 of file startup.c.

4.135.3.3 ReserveTempFiles()

```
void ReserveTempFiles (
             int par )
```

Definition at line 713 of file startup.c.

4.135.3.4 StartVariables()

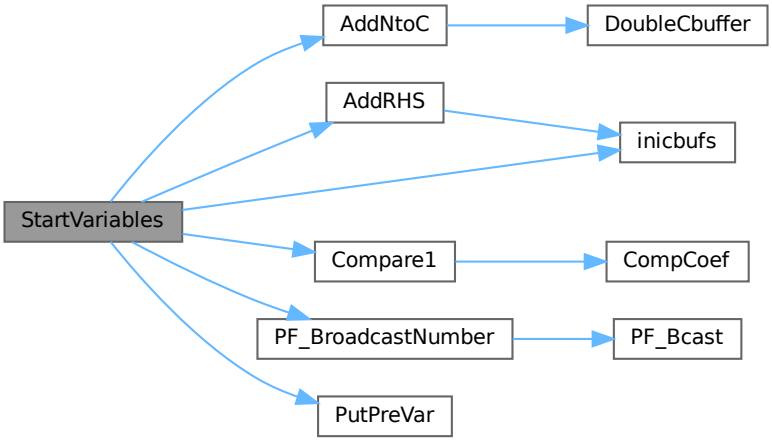
```
void StartVariables (
            void  )
```

All functions (well, nearly all) are declared here.

Definition at line 952 of file startup.c.

References AddNtoC(), AddRHS(), Compare1(), inicbufs(), FuNcTiOn::name, PF_BroadcastNumber(), PutPreVar(), and FuNcTiOn::symmetric.

Here is the call graph for this function:



4.135.3.5 StartMore()

```
void StartMore (
            void  )
```

Definition at line 1387 of file startup.c.

4.135.3.6 IniVars()

```
void IniVars (
            void  )
```

Definition at line 1425 of file startup.c.

4.135.3.7 main()

```
int main (
            int argc,
            char ** argv )
```

Definition at line 1732 of file startup.c.

4.135.3.8 CleanUp()

```
void CleanUp (
             WORD par )
```

Definition at line 1834 of file startup.c.

4.135.3.9 TerminateImpl()

```
void TerminateImpl (
             int errorcode,
             const char * file,
             int line,
             const char * function )
```

Definition at line 1923 of file startup.c.

4.135.3.10 PrintDeprecation()

```
void PrintDeprecation (
             const char * feature,
             const char * issue )
```

Prints a deprecation warning for a given feature.

Parameters

feature	The name of the deprecated feature.
issue	The associated issue, e.g., "issues/700".

Definition at line 2143 of file startup.c.

4.135.3.11 PrintRunningTime()

```
void PrintRunningTime (
             void  )
```

Definition at line 2167 of file startup.c.

4.135.3.12 GetRunningTime()

```
LONG GetRunningTime (
             void  )
```

Definition at line 2208 of file startup.c.

4.135.4 Variable Documentation

4.135.4.1 emptystring

```
UBYTE* emptystring = (UBYTE *)"."
```

Definition at line 707 of file startup.c.

4.135.4.2 defaulttempfilename

```
UBYTE* defaulttempfilename = (UBYTE *)"xformxxx.str"
```

4.137.1 Detailed Description

Contains all functions that deal with store-files and the system independent save-files.

Definition in file store.c.

4.137.2 Macro Definition Documentation

4.137.2.1 SAVEREVISION

```
#define SAVEREVISION 0x02
```

Definition at line 4029 of file store.c.

4.137.3 Function Documentation

4.137.3.1 OpenTemp()

```
void OpenTemp (
            void  )
```

Definition at line 48 of file store.c.

4.137.3.2 SeekScratch()

```
void SeekScratch (
            FILEHANDLE * fi,
            POSITION * pos )
```

Definition at line 63 of file store.c.

4.137.3.3 SetEndScratch()

```
void SetEndScratch (
            FILEHANDLE * f,
            POSITION * position )
```

Definition at line 74 of file store.c.

4.137.3.4 SetEndHScratch()

```
void SetEndHScratch (
            FILEHANDLE * f,
            POSITION * position )
```

Definition at line 88 of file store.c.

4.137.3.5 SetScratch()

```
void SetScratch (
            FILEHANDLE * f,
            POSITION * position )

Definition at line 3379 of file store.c.

4.137.3.29 WriteStoreHeader()

```
LONG WriteStoreHeader (
              WORD handle )
```

Writes header with information about system architecture and FORM revision to an open store file.

Called by SetFileIndex().

Parameters

handle	specifies open file to which header will be written

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4040 of file store.c.

References STOREHEADER::endianness, STOREHEADER::lenLONG, STOREHEADER::lenPOINTER, STOREHEADER::lenPOS, STOREHEADER::lenWORD, STOREHEADER::maxpower, STOREHEADER::sFun, STOREHEADER::sInd, STOREHEADER::sSym, STOREHEADER::sVec, and STOREHEADER::wildoffset.

Referenced by SetFileIndex().

4.137.3.30 ReadSaveHeader()

```
int ReadSaveHeader (
            void  )
```

Reads the header in the save file and sets function pointers and flags according to the information found there. Must be called before any other ReadSave... function.

Currently works only for the exchange between 32bit and 64bit machines (WORD size must be 2 or 4 bytes)!

It is called by CoLoad().

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4136 of file store.c.

4.137.3.31 ReadSaveIndex()

```
LONG ReadSaveIndex (
            FILEINDEX * fileind )
```

Reads a FILEINDEX from the open save file specified by AO.SaveData.Handle. Translations for adjusting endianness and data sizes are done if necessary.

Depends on the assumption that sizeof(FILEINDEX) is the same everywhere. If FILEINDEX or INDEXENTRY change, then this functions has to be adjusted.

Called by CoLoad() and FindInIndex().

Parameters

fileind	contains the read FILEINDEX after successful return. must point to allocated, big enough memory.

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4257 of file store.c.

References INFILEINDEX, FiLeInDeX::next, FiLeInDeX::number, and FuNcTiOn::number.

4.137.3.32 ReadSaveVariables()

```
LONG ReadSaveVariables (
            UBYTE * buffer,
            UBYTE * top,
            LONG * size,
            LONG * outsize,
            INDEXENTRY * ind,
            LONG * stage )
```

Reads the variables from the open file specified by AO.SaveData.Handle. It reads the ∗size bytes and writes them to the ∗buffer. It is called by PutInStore().

If translation is necessary, the data might shrink or grow in size, then ∗*size* is adjusted so that the reading and writing fits into the memory from the buffer to the top. The actual number of read bytes is returned in ∗*size*, the number of written bytes is returned in ∗*outsize*.

If the ∗size is smaller than the actual size of the variables, this function will be called several times and needs to remember the current position in the variable structure. The parameter *stage* does this job. When ReadSaveVariables() is called for the first time, this parameter should have the value -1.

The parameter *ind* is used to get the number of variables.

Parameters

buffer	read variables are written into this allocated memory
top	upper end of allocated memory
size	number of bytes to read. might return a smaller number of read bytes if translation was necessary
outsize	if translation has be done, outsize contains the number of written bytes
ind	pointer of INDEXENTRY for the current expression. read-only
stage	should be -1 for the first call, will be increased by ReadSaveVariables to memorize the position in the variable structure

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4445 of file store.c.

References InDeXeNtRy::nfunctions, InDeXeNtRy::nindices, InDeXeNtRy::nsymbols, InDeXeNtRy::nvectors, and FuNcTiOn::spec.

4.137.3.33 ReadSaveTerm32()

```
UBYTE * ReadSaveTerm32 (
             UBYTE * bin,
             UBYTE * binend,
             UBYTE ** bout,
             UBYTE * boutend,
             UBYTE * top,
             int terminbuf )
```

Reads a single term from the given buffer at *bin* and write the translated term back to this buffer at *bout*.

ReadSaveTerm32() is currently the only instantiation of a ReadSaveTerm-function. It only deals with data that already has the correct endianness and that is resized to 32bit words but without being renumbered or translated in any other way. It uses the compress buffer AR.CompressBuffer.

The function is reentrant in order to cope with nested function arguments. It is called by ReadSaveExpression() and itself.

The *return value* indicates the position in the input buffer up to which the data has already been successfully processed. The parameter *bout* returns the corresponding position in the output buffer.

Parameters

bin	start of the input buffer
binend	end of the input buffer
bout	as input points to the beginning of the output buffer, as output points behind the already translated data in the output buffer
boutend	end of already decompressed data in output buffer
top	end of output buffer
terminbuf	flag whether decompressed data is already in the output buffer. used in recursive calls

Returns

pointer to the next unprocessed data in the input buffer

Definition at line 4814 of file store.c.

References ReadSaveTerm32().

Referenced by ReadSaveExpression(), and ReadSaveTerm32().

Here is the call graph for this function:

4.137.3.34 ReadSaveExpression()

```
LONG ReadSaveExpression (
             UBYTE * buffer,
             UBYTE * top,
             LONG * size,
             LONG * outsize )
```

Reads an expression from the open file specified by AO.SaveData.Handle. The endianness flip and a resizing without renumbering is done in this function. Thereafter the buffer consists of chunks with a uniform maximal word size (32bit at the moment). The actual renumbering is then done by calling the function ReadSaveTerm32(). The result is returned in *buffer*.

If the translation at some point doesn't fit into the buffer anymore, the function returns and must be called again. In any case *size* returns the number of successfully read bytes, *outsize* returns the number of successfully written bytes, and the file will be positioned at the next byte after the successfully read data.

It is called by PutInStore().

Parameters

buffer	output buffer, holds the (translated) expression
top	end of buffer
size	number of read bytes
outsize	number of written bytes

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 5228 of file store.c.

References ReadSaveTerm32().

02045
02046     This routine takes an expression in the scratch buffer (indicated by e)
02047     and puts it in the storage file. The necessary actions are:
02048
02049     1:  determine the list of the used variables.
02050     2:  make an index entry.
02051     3:  write the namelists.
02052     4:  copy the 'length' bytes of the expression.
02053
02054 */

02858           #] FindInIndex :
02859           #[ GetTable :
02860
02861           Locates stored files and constructs the renumbering tables.
02862           They are allocated in the WorkSpace.
02863           First the expression data are located. The Index is treated
02864           as a circularly linked buffer which is paged forwardly.
02865           If the indexentry is located (in ind) the two renumber tables
02866           have to be constructed.
02867           Finally the prototype has to be put in the proper buffer, so
02868           that wildcards can be passed. There should be a test with
02869           an already existing prototype that is constructed by the
02870           pattern matcher. This has not been put in yet.
02871
02872           There is a problem with the parallel processing.
02873           Feeding in the variables that were erased by a .store could in
02874           principle happen in different orders (ParFORM) or simultaneously
02875           (TFORM). The proper resolution is to have the compiler call GetTable
02876           when a stored expression is encountered.
02877
```

```
02878         This has been mended in development of TFORM by reading the
02879         symbol tables during compilation. See the call to GetTable
02880         in the CodeGenerator.
02881
02882         Next is the problem of FindInIndex which writes in AR.StoreData
02883         Copying this is expensive!
02884
02885         This Doesn't work well for TFORM yet.!!!!!!!!
02886         e[x1,x2] versus e[x2,x1] messes up.
02887         For the rest is the reloading during execution not thread safe.
02888
02889         The parameter mode tells whether we should worry about arguments
02890         of a stored expression.

4.139.1 Detailed Description

Contains definitions for global structs.

!!!CAUTION!!! Changes in this file will most likely have consequences for the recovery mechanism (see checkpoint.c). You need to care for the code in checkpoint.c as well and modify the code there accordingly!

The marker [D] is used in comments in this file to mark pointers to which dynamically allocated memory is assigned by a call to malloc() during runtime (in contrast to pointers that point into already allocated memory). This information is especially helpful if one needs to know which pointers need to be freed (cf. checkpoint.c).

Definition in file structs.h.

4.139.2 Macro Definition Documentation

4.139.2.1 INFILEINDEX

```
#define INFILEINDEX ((512-2*sizeof(POSITION))/sizeof(INDEXENTRY))
```

Maximum number of entries (struct InDeXeNtRy) in a file index (struct FiLeInDeX). Number is calculated such that the size of a file index is no more than 512 bytes.

Definition at line 118 of file structs.h.

4.139.2.2 EMPTYININDEX

```
#define EMPTYININDEX (512-2*sizeof(POSITION)-INFILEINDEX*sizeof(INDEXENTRY))
```

Number of empty filling bytes for a file index (struct FiLeInDeX). It is calculated such that the size of a file index is always 512 bytes.

Definition at line 123 of file structs.h.

4.139.2.3 PHEAD

```
#define PHEAD
```

Definition at line 2529 of file structs.h.

4.139.2.4 PHEAD0

```
#define PHEAD0 void
```

Definition at line 2530 of file structs.h.

4.139.2.5 BHEAD

```
#define BHEAD
```

Definition at line 2531 of file structs.h.

4.139.2.6 BHEAD0

```
#define BHEAD0
```

Definition at line 2532 of file structs.h.

4.139.3 Typedef Documentation

4.139.3.1 INDEXENTRY

```
typedef struct InDeXeNtRy INDEXENTRY
```

Defines the structure of an entry in a file index (see struct FiLeInDeX).

It represents one expression in the file.

4.139.3.2 FILEINDEX

```
typedef struct FiLeInDeX FILEINDEX
```

Defines the structure of a file index in store-files and save-files.

It contains several entries (see struct InDeXeNtRy) up to a maximum of INFILEINDEX.

The variable number has been made of type POSITION to avoid padding problems with some types of computers/↩ OS and keep system independence of the .sav files.

This struct is always 512 bytes long.

4.139.3.3 VARRENUM

```
typedef struct VaRrEnUm VARRENUM
```

Contains the pointers to an array in which a binary search will be performed.

4.139.3.4 RENUMBER

```
typedef struct ReNuMbEr * RENUMBER
```

Only symb.lo gets dynamically allocated. All other pointers points into this memory.

4.139.3.5 NAMENODE

```
typedef struct NaMeNode NAMENODE
```

The names of variables are kept in an array. Elements of type NAMENODE define a tree (that is kept balanced) that make it easy and fast to look for variables. See also NAMETREE.

4.139.3.6 NAMETREE

```
typedef struct NaMeTree NAMETREE
```

A struct of type NAMETREE controls a complete (balanced) tree of names for the compiler. The compiler maintains several of such trees and the system has been set up in such a way that one could define more of them if we ever want to work with local name spaces.

4.139.3.7 COMPTREE

```
typedef struct tree COMPTREE
```

The subexpressions in the compiler are kept track of in a (balanced) tree to reduce the need for subexpressions and hence save much space in large rhs expressions (like when we have xxxxxxx occurrences of objects like f(x+1,x+1) in which each x+1 becomes a subexpression. The struct that controls this tree is COMPTREE.

4.139.3.8 TABLES

```
typedef struct TaBlEs * TABLES
```

buffers, mm, flags, and prototype are always dynamically allocated, tablepointers only if needed (=0 if unallocated), boomlijst and argtail only for sparse tables.

Allocation is done for both the normal and the stub instance (spare), except for prototype and argtail which share memory.

4.139.3.9 FUNCTIONS

```
typedef struct FuNcTiOn * FUNCTIONS
```

Contains all information about a function. Also used for tables. It is used in the LIST elements of AC.

4.139.3.10 FILEHANDLE

```
typedef struct FiLe FILEHANDLE
```

The type FILEHANDLE is the struct that controls all relevant information of a file, whether it is open or not. The file may even not yet exist. There is a system of caches (PObuffer) and as long as the information to be written still fits inside the cache the file may never be created. There are variables that can store information about different types of files, like scratch files or sort files. Depending on what is available in the system we may also have information about gzip compression (currently sort file only) or locks (TFORM).

4.139.3.11 STREAM

```
typedef struct StreaM STREAM
```

Input is read from 'streams' which are represented by objects of type STREAM. A stream can be a file, a do-loop, a procedure, the string value of a preprocessor variable ..... When a new stream is opened we have to keep information about where to fall back in the parent stream to allow this to happen even in the middle of reading names etc as would be the case with a`i'b

4.139.3.12 TRACES

```
typedef struct TrAcEs TRACES
```

The struct TRACES keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue. The 4-dimensional traces are more complicated than the n-dimensional traces (see TRACEN) because of the extra tricks that can be used. They are responsible for the shorter final expressions.

4.139.3.13 TRACEN

```
typedef struct TrAcEn * TRACEN
```

The struct TRACEN keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue.

4.139.3.14 PREVAR

```
typedef struct pReVaR PREVAR
```

An element of the type PREVAR is needed for each preprocessor variable.

4.139.3.15 DOLOOP

```
typedef struct DoLoOp DOLOOP
```

Each preprocessor do loop has a struct of type DOLOOP to keep track of all relevant parameters like where the beginning of the loop is, what the boundaries, increment and value of the loop parameter are, etc. Also we keep the whole loop inside a buffer of type PRELOAD

4.139.3.16 set_of_char

```
typedef struct bit_field set_of_char[32]
```

Used in set_in, set_set, set_del and set_sub.

Definition at line 930 of file structs.h.

4.139.3.17 one_byte

```
typedef struct bit_field* one_byte
```

Used in set_in, set_set, set_del and set_sub.

Definition at line 936 of file structs.h.

4.139.3.18 FINISHUFFLE

```
typedef int(* FINISHUFFLE) (WORD *)
```

Definition at line 956 of file structs.h.

4.139.3.19 DO_UFFLE

```
typedef int(* DO_UFFLE) (WORD *, WORD, WORD, WORD)
```

Definition at line 957 of file structs.h.

4.139.3.20 COMPAREDUMMY

```
typedef WORD(* COMPAREDUMMY) (WORD *, WORD *, WORD)
```

Definition at line 962 of file structs.h.

4.139.3.21 CBUF

```
typedef struct CbUf CBUF
```

The CBUF struct is used by the compiler. It is a compiler buffer of which since version 3.0 there can be many.

4.139.3.22 CHANNEL

```
typedef struct ChAnNeL CHANNEL
```

When we read input from text files we have to remember not only their handle but also their name. This is needed for error messages. Hence we call such a file a channel and reserve a struct of type CHANNEL to allow to lay this link.

4.139.3.23 NESTING

```
typedef struct NeStInG * NESTING
```

The NESTING struct is used when we enter the argument of functions and there is the possibility that we have to change something there. Because functions can be nested we have to keep track of all levels of functions in case we have to move the outer layers to make room for a larger function argument.

4.139.3.24 STORECACHE

```
typedef struct StOrEcAcHe * STORECACHE
```

The struct of type STORECACHE is used by a caching system for reading terms from stored expressions. Each thread should have its own system of caches.

4.139.3.25 PERM

```
typedef struct PeRmUtE PERM
```

The struct PERM is used to generate all permutations when the pattern matcher has to try to match (anti)symmetric functions.

4.139.3.26 PERMP

```
typedef struct PeRmUtEp PERMP
```

Like struct PERM but works with pointers.

4.139.3.27 DISTRIBUTE

```
typedef struct DiStRiBuTe DISTRIBUTE
```

The struct DISTRIBUTE is used to help the pattern matcher when matching antisymmetric tensors.

4.139.3.28 PARTI

```
typedef struct PaRtI PARTI
```

The struct PARTI is used to help determining whether a partition_ function can be replaced.

4.139.3.29 SORTING

```
typedef struct sOrT SORTING
```

The struct SORTING is used to control a sort operation. It includes a small and a large buffer and arrays for keeping track of various stages of the (merge) sorts. Each sort level has its own struct and different levels can have different sizes for its arrays. Also different threads have their own set of SORTING structs.

4.139.3.30 ALLGLOBALS

```
typedef struct AllGlobals ALLGLOBALS
```

Without pthreads (FORM) the ALLGLOBALS struct has all the global variables

4.139.3.31 WCN

```
typedef int(* WCN) (PHEAD WORD *, WORD *, WORD, WORD)
```

Definition at line 2535 of file structs.h.

4.139.3.32 WCN2

```
typedef int(* WCN2) (PHEAD WORD *, WORD *)
```

Definition at line 2536 of file structs.h.

4.139.3.33 COMPARE

```
typedef WORD(* COMPARE) (PHEAD WORD *, WORD *, WORD)
```

Definition at line 2538 of file structs.h.

4.139.3.34 FIXEDGLOBALS

```
typedef struct FixedGlobals FIXEDGLOBALS
```

The FIXEDGLOBALS struct is an anachronism. It started as the struct with global variables that needed initialization. It contains the elements Operation and OperaFind which define a very early way of automatically jumping to the proper operation. We find the results of it in parts of the file opera.c Later operations were treated differently in a more transparent way. We never changed the existing code. The most important part is currently the cTable which is used intensively in the compiler.

4.141.1 Detailed Description

The routines that deal with the pattern matching of functions with symmetric properties.

Definition in file symmetr.c.

4.141.2 Function Documentation

4.141.2.1 MatchE()

```
int MatchE (
            PHEAD WORD * pattern,
            WORD * fun,
            WORD * inter,
            WORD par )
```

Definition at line 56 of file symmetr.c.

4.141.2.2 Permute()

```
int Permute (
            PERM * perm,
            WORD first )
```

Definition at line 444 of file symmetr.c.

4.141.2.3 PermuteP()

```
int PermuteP (
              PERMP * perm,
              WORD first )
```

Definition at line 478 of file symmetr.c.

4.141.2.4 Distribute()

```
int Distribute (
              DISTRIBUTE * d,
              WORD first )
```

Definition at line 510 of file symmetr.c.

4.141.2.5 MatchCy()

```
int MatchCy (
              PHEAD WORD * pattern,
              WORD * fun,
              WORD * inter,
              WORD par )
```

Definition at line 571 of file symmetr.c.

4.141.2.6 FunMatchCy()

```
int FunMatchCy (
              PHEAD WORD * pattern,
              WORD * fun,
              WORD * inter,
              WORD par )
```

Definition at line 1067 of file symmetr.c.

4.141.2.7 FunMatchSy()

```
int FunMatchSy (
              PHEAD WORD * pattern,
              WORD * fun,
              WORD * inter,
              WORD par )
```

Definition at line 1525 of file symmetr.c.

4.141.2.8 MatchArgument()

```
int MatchArgument (
              PHEAD WORD * arg,
              WORD * pat )
```

Definition at line 2052 of file symmetr.c.

4.142 symmetr.c

00041
00042         Matches symmetric and antisymmetric tensors.
00043         Pattern and fun point at a tensor.
00044         Problem is the wildcarding and all its possible permutations.
00045         This routine loops over all of them and calls for each
00046         possible wildcarding the recursion in ScanFunctions.
00047         Note that this can be very costly.
00048
00049         Originally this routine did only Levi Civita tensors and hence
00050         it dealt only with commuting objects.
00051         Because of the backtracking we cannot fall back to the calling
00052         ScanFunctions routine and check the sequence of functions when
00053         non-commuting objects are involved.

00312   Now there are only free wildcards left.
00313   Possibly the assigned values ate too many vectors.
00314   The rest has to be done the 'hard way' via permutations.
00315   This is too bad when there are 10 indices.
00316   This could cause 10! tries.
00317   We try to avoid the worst case by using a very special
00318   (somewhat slow) permutation routine that has as its worst
00319   cases some rather unlikely configurations, rather than some
00320   common ones (as would have been the case with the conventional
00321   permutation routine).
00322       assume:
00323       vvvvvvvvvvvviiiiiii     (tvfix in tfixvec and tifix in tfixind)
00324       VVVVVVVVVIIIIIIIII      (vwc in wcvec and iwc in wcind)
00325   Note: all further assignments are possible at this point!
00326   Strategy:
00327       permute v
00328       permute i
00329       loop over the ordered distribution of the leftover v's
00330       through the i's.

00428
00429         Special permutation function.
00430         Works recursively.
00431         The aim is to cycle through in as fast a way as possible,
00432         to take care that each object hits the various positions
00433         already early in the game.
00434
00435         Start at two: -> cycle of two
00436         then three -> cycle of three
00437         etc;
00438         The innermost cycle is the longest. This is the opposite
00439         of the usual way of generating permutations and it is
00440         certainly not the fastest one. It allows for the fastest
00441         hit in the assignment of wildcards though.

4.143.1 Detailed Description

Contains all functions that deal with the table bases on the 'FORM level' The low level database routines are in minos.c

Definition in file tables.c.

4.143.2 Function Documentation

4.143.2.1 ClearTableTree()

```
void ClearTableTree (
             TABLES T )
```

Definition at line 72 of file tables.c.

4.143.2.2 InsTableTree()

```
int InsTableTree (
             TABLES T,
             WORD * tp )
```

Definition at line 103 of file tables.c.

4.143.2.3 RedoTableTree()

```
void RedoTableTree (
             TABLES T,
             int newsize )
```

Definition at line 268 of file tables.c.

4.143.2.4 FindTableTree()

```
int FindTableTree (
             TABLES T,
             WORD * tp,
             int inc )
```

Definition at line 293 of file tables.c.

4.143.2.5 DoTableExpansion()

```
int DoTableExpansion (
            WORD * term,
            WORD level )
```

Definition at line 338 of file tables.c.

4.143.2.6 CoTableBase()

```
int CoTableBase (
            UBYTE * s )
```

Definition at line 633 of file tables.c.

4.143.2.7 FlipTable()

```
int FlipTable (
            FUNCTIONS f,
            int type )
```

Definition at line 677 of file tables.c.

4.143.2.8 SpareTable()

```
int SpareTable (
            TABLES TT )
```

Definition at line 700 of file tables.c.

4.143.2.9 FindTB()

```
DBASE * FindTB (
            UBYTE * name )
```

Definition at line 740 of file tables.c.

4.143.2.10 CoTBcreate()

```
int CoTBcreate (
            UBYTE * s )
```

Definition at line 762 of file tables.c.

4.143.2.11 CoTBopen()

```
int CoTBopen (
            UBYTE * s )
```

Definition at line 778 of file tables.c.

4.143.2.12 CoTBaddto()

```
int CoTBaddto (
            UBYTE * s )
```

Definition at line 807 of file tables.c.

4.143.2.13 CoTBenter()

```
int CoTBenter (
            UBYTE * s )
```

Definition at line 980 of file tables.c.

4.143.2.14 CoTestUse()

```
int CoTestUse (
            UBYTE * s )
```

Definition at line 1139 of file tables.c.

4.143.2.15 CheckTableDeclarations()

```
int CheckTableDeclarations (
            DBASE * d )
```

Definition at line 1184 of file tables.c.

4.143.2.16 CoTBload()

```
int CoTBload (
            UBYTE * ss )
```

Definition at line 1258 of file tables.c.

4.143.2.17 TestUse()

```
int TestUse (
            WORD * term,
            WORD level )
```

Definition at line 1420 of file tables.c.

4.143.2.18 CoTBaudit()

```
int CoTBaudit (
            UBYTE * s )
```

Definition at line 1482 of file tables.c.

4.143.2.19 CoTBon()

```
int CoTBon (
            UBYTE * s )
```

Definition at line 1522 of file tables.c.

4.143.2.20 CoTBoff()

```
int CoTBoff (
            UBYTE * s )
```

Definition at line 1553 of file tables.c.

4.143.2.21 CoTBcleanup()

```
int CoTBcleanup (
            UBYTE * s )
```

Definition at line 1584 of file tables.c.

4.143.2.22 CoTBreplace()

```
int CoTBreplace (
            UBYTE * s )
```

Definition at line 1596 of file tables.c.

4.143.2.23 CoTBuse()

```
int CoTBuse (
            UBYTE * s )
```

Definition at line 1611 of file tables.c.

4.143.2.24 CoApply()

```
int CoApply (
            UBYTE * s )
```

Definition at line 1809 of file tables.c.

4.143.2.25 CoTBhelp()

```
int CoTBhelp (
            UBYTE * s )
```

Definition at line 1896 of file tables.c.

4.143.2.26 ReWorkT()

```
void ReWorkT (
             WORD * term,
             WORD * funs,
             WORD numfuns )
```

Definition at line 1912 of file tables.c.

4.143.2.27 Apply()

```
void Apply (
             WORD * term,
             WORD level )
```

Definition at line 1993 of file tables.c.

4.143.2.28 ApplyExec()

```
int ApplyExec (
             WORD * term,
             int maxtogo,
             WORD level )
```

Definition at line 2051 of file tables.c.

4.143.2.29 ApplyReset()

```
void ApplyReset (
             WORD level )
```

Definition at line 2268 of file tables.c.

4.143.2.30 TableReset()

```
void TableReset (
             void  )
```

Definition at line 2303 of file tables.c.

4.143.2.31 ReleaseTB()

```
int ReleaseTB (
             void  )
```

Definition at line 2329 of file tables.c.

00033     #[ Includes :
00034
00035     File contains the routines for the tree structure of sparse tables
00036     We insert elements by
00037     InsTableTree(T,tp) with T the TABLES element and tp the pointer
00038         to the indices.
00039     We look for elements with
00040     FindTableTree(T,tp,inc) with T the TABLES element, tp the pointer to the
00041         indices or the function arguments and inc tells which of these options.
00042     The tree is cleared with ClearTableTree(T) and we rebuild the tree
00043     after a .store in which we lost a part of the table with
00044     RedoTableTree(T,newsize)
00045
00046     In T->tablepointers we have the lists of indices for each element.
00047     Additionally for each element there is an extension. There are
00048     TABLEEXTENSION WORDs reserved for that. The old system had two words
00049     One for the element in the rhs of the compile buffer and one for
00050     an additional rhs in case the original would be overwritten by a new
00051     definition, but the old was fixed by .global and hence it should be possible
00052     to restore it.
00053     New use (new = 24-sep-2001)
00054         rhs1,numCompBuffer1,rhs2,numCompBuffer2,usage
00055     Hence TABLEEXTENSION will be 5. Note that for 64 bits the use of the
00056     compiler buffer is overdoing it a bit, but it would be too complicated
00057     to try to give it special code.

00571     #] DoTableExpansion :
00572     #[ TableBase :
00573
00574     File with all the database related things.
00575     We have the routines for the generic database command
00576     TableBase,options;
00577     TB,options;
00578     Options are:
00579         Open "File.tbl";                    Open for R/W
00580         Open "File.tbl", readonly;          Open for R
00581         Create "File.tbl";                  Create for write
00582         Load "File.tbl", tablename;         Loads stubs of table
00583         Load "File.tbl";                    Loads stubs of all tables
00584         Enter "File.tbl", tablename;        Loads whole table
00585         Enter "File.tbl";                   Loads all tables
00586         Audit "File.tbl", options;          Print list of contents
00587         Replace "File.tbl", tablename;      Saves a table (with overwrite)
00588         Replace "File.tbl", table element; Saves a table element   „
00589         Cleanup "File.tbl";                 Makes tables contingent
00590         AddTo "File.tbl" tablename;         Add if not yet there.
00591         AddTo "File.tbl" table element;     Add if not yet there.
00592         Delete "File.tbl" tablename;
```

```
00593         Delete "File.tbl" table element;
00594
00595         On/Off substitute;
00596         On/Off compress "File.tbl";
00597     id tbl_(f?,?a) = f(?a);
00598     When a tbl_ is used, automatically the corresponding element is compiled
00599     at the start of the next module.
00600     if TB,On,substitute [tablename], use of table RHS (if loaded)
00601     if TB,Off,substitute [tablename], use of tbl_(table,...);
00602
00603
00604     Still needed: Something like OverLoad to allow loading parts of a table
00605     from more than one file. Date stamps needed? In that case we need a touch
00606     command as well.
00607
00608     If we put all our diagrams inside, we have to go outside the concept
00609     of tables.

4.145 threads.c File Reference

4.145.1 Detailed Description

Routines for the interface of FORM with the pthreads library

This is the main part of the parallelization of TFORM. It is important to also look in the files structs.h and variable.h because the treatment of the A and B structs is essential (these structs are used by means of the macros AM, AP, AC, AS, AR, AT, AN, AO and AX). Also the definitions and use of the macros BHEAD and PHEAD should be looked up.

The sources are set up in such a way that if WITHPTHREADS isn't defined there is no trace of pthread parallelization. The reason is that TFORM is far more memory hungry than sequential FORM.

Special attention should also go to the locks. The proper use of the locks is essential and determines whether TFORM can work at all. We use the LOCK/UNLOCK macros which are empty in the case of sequential FORM These locks are at many places in the source files when workers can interfere with each others data or with the data of the master.

Definition in file threads.c.

00055     The sortbot additions are from 17-may-2007 and after. They constitute
00056     an attempt to make the final merge sorting faster for the master.
00057     This way the master has only one compare per term.
00058     It does add some complexity, but the final merge routine (MasterMerge)
00059     is much simpler for the sortbots. On the other hand the original merging is
00060     for a large part a copy of the MergePatches routine in sort.c and hence
00061     even though complex the bad part has been thoroughly debugged.

00430             12-jun-2007 JV:
00431     For the timing one has to know a few things:
00432     The POSIX standard is that there is only a single process ID and that
00433     getrusage returns the time of all the threads together.
00434     Under Linux there are two methods though: The older LinuxThreads and NPTL.
00435     LinuxThreads gives each thread its own process id. This makes that we
00436     can time the threads with getrusage, and hence this was done. Under NPTL
00437     this has been 'corrected' and suddenly getruage doesn't work anymore the
00438     way it used to. Now we need
00439         clock_gettime(CLOCK_THREAD_CPUTIME_ID,&timing)
00440     which is declared in <time.h> and we need -lrt extra in the link statement.
00441     (this is at least the case on blade02 at DESY-Zeuthen).
00442     See also the code in tools.c at the routine Timer.

01827             #[ DOBRACKETS :
01828
01829                 In case we have a bracket index we can have the worker treat
01830                 one or more of the entries in the bracket index.
01831                 The advantage is that identical terms will meet each other
01832                 sooner in the sorting and hence fewer compares will be needed.
01833                 Also this way the master doesn't need to fill the buckets.
01834                 The main problem is the load balancing which can become very
01835                 bad when there is a long tail without things outside the bracket.
01836
01837                 We get sent:

03207
03208         There is still a serious problem.
03209         When for instance a sum_, there may be space created in a local
03210         compiler buffer for a wildcard substitution or whatever.
03211         Compiler buffer execution scribble space.....
03212         This isn't copied along?
03213         Look up ebufnum. There are 12 places with AddRHS!
03214         Problem: one process allocates in ebuf. Then term is given to
03215         other process. It would like to use from this ebuf, but the sender
03216         finishes first and removes the ebuf (and/or overwrites it).
03217
03218         Other problem: local $ variables aren't copied along.

4.147.1 Detailed Description

The tokenizer. This is a part of the compiler that does an intermediate type of translation. It does look up the names etc and can do a number of optimizations. The resulting output is a stream of bytes which can be processed by the code generator (in the file compiler.c)

Definition in file token.c.

4.147.2 Macro Definition Documentation

4.147.2.1 CHECKPOLY

```
#define CHECKPOLY {if(polyflag)MesPrint("&Illegal use of polynomial function"); polyflag = 0;
}
```

Definition at line 56 of file token.c.

4.147.3 Function Documentation

4.147.3.1 tokenize()

```
int tokenize (
            UBYTE * in,
            WORD leftright )
```

Definition at line 58 of file token.c.

4.147.3.2 WriteTokens()

```
void WriteTokens (
            SBYTE * in )
```

Definition at line 652 of file token.c.

4.147.3.3 simp1token()

```
int simp1token (
            SBYTE * s )
```

Definition at line 700 of file token.c.

4.147.3.4 simpwtoken()

```
int simpwtoken (
            SBYTE * s )
```

Definition at line 789 of file token.c.

4.147.3.5 simp2token()

```
int simp2token (
            SBYTE * s )
```

Definition at line 943 of file token.c.

4.147.3.6 simp3atoken()

```
int simp3atoken (
            SBYTE * s,
            int mode )
```

Definition at line 1191 of file token.c.

4.147.3.7 simp3btoken()

```
int simp3btoken (
            SBYTE * s,
            int mode )
```

Definition at line 1432 of file token.c.

4.147.3.8 simp4token()

```
int simp4token (
            SBYTE * s )
```

Definition at line 1843 of file token.c.

4.147.3.9 simp5token()

```
int simp5token (
            SBYTE * s,
            int mode )
```

Definition at line 2005 of file token.c.

4.147.3.10 simp6token()

```
int simp6token (
            SBYTE * tokens,
            int mode )
```

Definition at line 2051 of file token.c.

4.147.4 Variable Documentation

4.147.4.1 ttypes

```
char* ttypes[]
```

Initial value:

```
= { "\n", "S", "I", "V", "F", "set", "E", "dotp", "#",
   "sub", "d_", "$", "dub", "(", ")", "?", "??", ".", "[", "]",

4.149.1 Detailed Description

Low level routines for many types of task. There are routines for manipulating the input system (streams and files) routines for string manipulation, the memory allocation interface, and the clock. The last is the most sensitive to ports. In the past nearly every port to another OS or computer gave trouble. Nowadays it is slightly better but the poor POSIX compliance of LINUX again gave problems for the multithreaded version.

4.149.2 Macro Definition Documentation

4.149.2.1 FILLVALUE

```
#define FILLVALUE 0
```

Definition at line 49 of file tools.c.

4.149.2.2 TERMMEMSTARTNUM

```
#define TERMMEMSTARTNUM 16
```

Provides memory for one term (or one small polynomial) This means that the memory is limited to a buffer of size AM.MaxTer plus a few extra words. In parallel versions, each worker has its own memory pool.

The way we use the memory is by: term = TermMalloc(BHEAD0); and later we free it by TermFree(BHEAD term);

Layout: We have a list of available pointers to buffers: AT.TermMemHeap Its size is AT.TermMemMax We take from the top (indicated by AT.TermMemTop). When we run out of buffers we assign new ones (doubling the amount) and we have to extend the AT.TermMemHeap array. Important: There is no checking that the returned memory is legal, ie is memory that was handed out earlier.

Definition at line 2487 of file tools.c.

4.149.2.3 TERMEXTRAWORDS

```
#define TERMEXTRAWORDS 10
```

Definition at line 2488 of file tools.c.

4.149.2.4 NUMBERMEMSTARTNUM

```
#define NUMBERMEMSTARTNUM 16
```

Provides memory for one Long number This means that the memory is limited to a buffer of size AM.MaxTal In parallel versions, each worker has its own memory pool.

The way we use the memory is by: num = NumberMalloc(BHEAD0); Number = AT.NumberMemHeap[num]; and later we free it by NumberFree(BHEAD num);

Layout: We have a list of available pointers to buffers: AT.NumberMemHeap Its size is AT.NumberMemMax We take from the top (indicated by AT.NumberMemTop). When we run out of buffers we assign new ones (doubling the amount) and we have to extend the AT.NumberMemHeap array. Important: There is no checking on the returned memory!!!!

4.149.2.5 NUMBEREXTRAWORDS

```
#define NUMBEREXTRAWORDS 10L
```

Definition at line 2588 of file tools.c.

4.149.2.6 DODOUBLE

```
#define DODOUBLE(
               x )
```

Value:

```
{ x *s, *t, *u; if ( *start ) { \
oldsize = *(x **)stop - *(x **)start; newsize = 2*oldsize; \
t = u = (x *)Malloc1(newsize*sizeof(x),text); s = *(x **)start; \
for ( i = 0; i < oldsize; i++ ) {*t++ = *s++;} M_free(*start,"double"); } \
else { newsize = 100; u = (x *)Malloc1(newsize*sizeof(x),text); } \
*start = (void *)u; *stop = (void *)(u+newsize); }
```

Definition at line 2914 of file tools.c.

4.149.2.7 DOEXPAND

```
#define DOEXPAND(
               x )
```

Value:

```
{ x *newbuffer, *t, *m;                                \
t = newbuffer = (x *)Malloc1((newsize+2)*type,"ExpandBuffer");      \
if ( *buffer ) { m = (x *)*buffer; i = *oldsize;                    \
    while ( --i >= 0 ) {*t++ = *m++;} M_free(*buffer,"ExpandBuffer"); \
} *buffer = newbuffer; *oldsize = newsize; }

4.149.3.47 strDup1()

```
UBYTE * strDup1 (
            UBYTE * instring,
            char * ifwrong )
```

Definition at line 1908 of file tools.c.

4.149.3.48 EndOfToken()

```
UBYTE * EndOfToken (
            UBYTE * s )
```

Skips over alphanumeric characters to find the end of the token.

Note

This function does not handle formal names (e.g., `[x+a]`). To handle them, use `SkipAName` instead.

Parameters

in	*s*	Pointer to a null-terminated input buffer.

Returns

Pointer to the first non-alphanumeric character (i.e., the character immediately after the token), or the null terminator if the token reaches the end of the string.

Definition at line 1934 of file tools.c.

4.149.3.49 ToToken()

```
UBYTE * ToToken (
            UBYTE * s )
```

Skips over non-alphanumeric characters to find the start of a token.

Note

This function does not handle formal names (e.g., `[x+a]`). To handle them, consider simply skipping whitespace, e.g., by using `SkipSpaces`.

Parameters

in	*s*	Pointer to a null-terminated input buffer.

Returns

Pointer to the first alphanumeric character (i.e., the start of the token), or the null terminator if none is found.

Definition at line 1957 of file tools.c.

4.149.3.50 SkipField()

```
UBYTE * SkipField (
            UBYTE * s,
            int level )
```

Skips from `s` to the end of a declaration field (e.g., `x`, `1+2*[x+a]`, or `f({x,[x+a]},1)`).

Parameters

in	*s*	Pointer to a null-terminated input buffer.
in	*level*	Number of parentheses that still have to be closed.

Returns

Pointer to the character after the field, which is either a comma at level 0 or the null terminator.

Definition at line 1978 of file tools.c.

            WORD * arg2 )
```

Definition at line 3222 of file tools.c.

4.149.3.82 CompArg()

```
int CompArg (
            WORD * s1,
            WORD * s2 )
```

Definition at line 3253 of file tools.c.

4.149.3.83 TimeWallClock()

```
LONG TimeWallClock (
            WORD par )
```

Returns the wall-clock time.

Parameters

par	If zero, the wall-clock time will be reset to 0.

Returns

The wall-clock time in centiseconds.

Definition at line 3425 of file tools.c.

Referenced by DoCheckpoint(), DoRecovery(), find_Horner_MCTS(), optimize_expression_given_Horner(), optimize_greedy(), and WriteStats().

4.149.3.84 TimeChildren()

```
LONG TimeChildren (
            WORD par )
```

Definition at line 3481 of file tools.c.

4.149.3.85 TimeCPU()

```
LONG TimeCPU (
            WORD par )
```

Returns the CPU time.

Parameters

par	If zero, the CPU time will be reset to 0.

Returns

The CPU time in milliseconds.

Definition at line 3499 of file tools.c.

Referenced by PF_GetSlaveTimes(), PF_Processor(), and WriteStats().

4.149.3.86 Crash()

```
int Crash (
            void  )
```

Definition at line 3784 of file tools.c.

4.149.3.87 TestTerm()

```
int TestTerm (
            WORD * term )
```

Tests the consistency of the term. Returns 0 when the term is OK. Any nonzero value is trouble. In the current version the testing isn't 100% complete. For instance, we don't check the validity of the symbols nor do we check the range of their powers. Etc. This should be extended when the need is there.

Parameters

term	the term to be tested

Definition at line 3812 of file tools.c.

References TestTerm().

Referenced by TestTerm().

01247         #[ ReadPosFile :
01248
01249         Gets words from a file(handle).
01250         First tries to get the information from the buffers.
01251         Reads a file at a position. Updates the position.
01252         Places a lock in the case of multithreading.
01253         Exists for multiple reading from the same file.
01254         size is the number of WORDs to read!!!!
01255
01256         We may need some strategy in the caching. This routine is used from
01257         GetOneTerm only. The problem is when it reads brackets and the
01258         brackets are read backwards. This is very uneconomical because
01259         each time it may read a large buffer.
01260         On the other hand, reading piece by piece in GetOneTerm takes
01261         much overhead as well.
01262         Two strategies come to mind:
01263         1: keep things as they are but limit the size of the buffers.
01264         2: have the position of 'pos' at about 1/3 of the buffer.
01265            this is of course guess work.
01266         Currently we have implemented the first method by creating the
01267         setup parameter threadscratchsize with the default value 100K.
01268         In the test program much bigger values gave a slower program.

4.151.1 Detailed Description

Routines that deal with the transform statement and its varieties.

Definition in file transform.c.

4.151.2 Function Documentation

4.151.2.1 CoTransform()

```
int CoTransform (
            UBYTE * in )
```

Definition at line 87 of file transform.c.

4.151.2.2 RunTransform()

```
int RunTransform (
            PHEAD WORD * term,
            WORD * params )
```

Definition at line 750 of file transform.c.

4.151.2.3 RunEncode()

```
int RunEncode (
            PHEAD WORD * fun,
            WORD * args,
            WORD * info )
```

Definition at line 1008 of file transform.c.

4.151.2.4 RunDecode()

```
int RunDecode (
            PHEAD WORD * fun,
            WORD * args,
            WORD * info )
```

Definition at line 1197 of file transform.c.

4.151.2.5 RunReplace()

```
int RunReplace (
            PHEAD WORD * fun,
            WORD * args,
            WORD * info )
```

Definition at line 1369 of file transform.c.

4.151.2.6 RunImplode()

```
int RunImplode (
            WORD * fun,
            WORD * args )
```

Definition at line 1849 of file transform.c.

4.151.2.7 RunExplode()

```
int RunExplode (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 2050 of file transform.c.

4.151.2.8 RunPermute()

```
int RunPermute (
            PHEAD WORD * fun,
            WORD * args,
            WORD * info )
```

Definition at line 2164 of file transform.c.

4.151.2.9 RunReverse()

```
int RunReverse (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 2391 of file transform.c.

4.151.2.10 RunDedup()

```
int RunDedup (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 2478 of file transform.c.

4.151.2.11 RunCycle()

```
int RunCycle (
            PHEAD WORD * fun,
            WORD * args,
            WORD * info )
```

Definition at line 2567 of file transform.c.

4.151.2.12 RunAddArg()

```
int RunAddArg (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 2719 of file transform.c.

4.151.2.13 RunMulArg()

```
int RunMulArg (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 2808 of file transform.c.

4.151.2.14 RunIsLyndon()

```
int RunIsLyndon (
            PHEAD WORD * fun,
            WORD * args,
            int par )
```

Definition at line 2949 of file transform.c.

4.151.2.15 RunToLyndon()

```
WORD RunToLyndon (
            PHEAD WORD * fun,
            WORD * args,
            int par )
```

Definition at line 3027 of file transform.c.

4.151.2.16 RunDropArg()

```
int RunDropArg (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 3139 of file transform.c.

4.151.2.17 RunSelectArg()

```
int RunSelectArg (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 3165 of file transform.c.

4.151.2.18 RunZtoHArg()

```
int RunZtoHArg (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 3193 of file transform.c.

4.151.2.19 RunHtoZArg()

```
int RunHtoZArg (
            PHEAD WORD * fun,
            WORD * args )
```

Definition at line 3249 of file transform.c.

4.151.2.20 TestArgNum()

```
int TestArgNum (
            int n,
            int totarg,
            WORD * args )
```

Definition at line 3315 of file transform.c.

4.151.2.21 PutArgInScratch()

```
WORD PutArgInScratch (
              WORD * arg,
              UWORD * scrat )
```

Definition at line 3384 of file transform.c.

4.151.2.22 ReadRange()

```
UBYTE * ReadRange (
              UBYTE * s,
              WORD * out,
              int par )
```

Definition at line 3420 of file transform.c.

4.151.2.23 FindRange()

```
int FindRange (
              PHEAD WORD * args,
              WORD * arg1,
              WORD * arg2,
              WORD totarg )
```

Definition at line 3580 of file transform.c.

4.152 transform.c

00037 /*
00038     #] Includes :
00039     #[ Transform :
00040         #[ Intro :
00041
00042         Here are the routines for the transform statement. This is a
00043         group of transformations on function arguments or groups of
00044         function arguments. The purpose of this command is that it
00045         avoids repetitive pattern matching.
00046         Syntax:
00047             Transform,SetOfFunctions,OneOrMoreTransformations;
00048         Each transformation is given by
00049             Replace(argfirst,arglast)=(„,)
00050             Encode(argfirst,arglast):base=#
00051             Decode(argfirst,arglast):base=#
00052             Implode(argfirst,arglast)
00053             Explode(argfirst,arglast)
00054             Permute(cycle)(cycle)(cycle)...(cycle)
00055             Reverse(argfirst,arglast)
00056             Dedup(argfirst,arglast)
00057             Cycle(argfirst,arglast)=+/-num
00058             IsLyndon(argfirst,arglast)=(yes,no)
00059             ToLyndon(argfirst,arglast)=(yes,no)
00060         In replace the extra information is
00061             a replace_() without the name of the replace_ function.
00062             This can be as in (0,1,1,0) or (xarg_,1-xarg_) to indicate
00063             a symbolic argument or (x,y,y,x) to exchange x and y, etc.
00064         In Encode and Decode argfirst is the most significant 'word' and
00065         arglast is the least significant 'word'.
00066         Note that we need to introduce the generic symbolic arguments xarg_,
00067         parg_, iarg_ and farg_.
00068         Examples:
00069             Transform,{H,E}
00070                     ,Replace(1:'WEIGHT')=(0,1,1,0)
00071                     ,Encode(1:'WEIGHT')=base(2);
00072             Transform,{H,E}
00073                     ,Decode(1:'WEIGHT')=base(3)
00074                     ,Replace(1:'WEIGHT')=(2,-1,1,0,0,1);
00075         Others that can be added:
00076             symmetrize?
00077
00078         6-may-2016: Changed MAXPOSITIVE2 into MAXPOSITIVE4. This makes room
00079                     for the use of dollar variables as arguments.
00080

4.157.1 Detailed Description

Contains a number of defines to make the coding easier. Especially the defines for the use of the lists are very nice. And of course the AC for A.Cc and AT for either A.T of B->T are indispensable to keep FORM and TFORM in one set of sources.

Definition in file variable.h.

4.157.2 Macro Definition Documentation

4.157.2.1 chartype

4.159.1 Detailed Description

An implementation of dynamic array.

Example:
```
size_t i;
Vector(int, vec);
VectorPushBack(vec, 1);
VectorPushBack(vec, 2);
VectorPushBack(vec, 3);
for ( i = 0; i < VectorSize(vec); i++ )
  printf("%d\n", VectorPtr(vec)[i]);
VectorFree(vec);
```

Definition in file vector.h.

4.159.2 Macro Definition Documentation

4.159.2.1 VectorStruct

```
#define VectorStruct(
                T )
```

Value:
```
    struct { \
        T *ptr; \
        size_t size; \
        size_t capacity; \
    }
```

A struct for vector objects.

Parameters

T	the type of elements.

Definition at line 65 of file vector.h.

4.159.2.2 Vector

```
#define Vector(
              T,
              X )  VectorStruct(T) X = { NULL, 0, 0 }
```

Defines and initialises a vector X of the type T. The user must call VectorFree(X) after the use of X.

Parameters

T	the type of elements.
X	the name of vector object

Definition at line 84 of file vector.h.

4.159.2.3 DeclareVector

```
#define DeclareVector(
              T,
              X )  VectorStruct(T) X
```

Declares a vector X of the type T. The user must call VectorInit(X) before the use of X.

Parameters

T	the type of elements.
X	the name of vector object

Definition at line 99 of file vector.h.

4.159.2.4 VectorInit

```
#define VectorInit(
              X )
```

Value:

```
    do { \
        (X).ptr = NULL; \
        (X).size = 0; \
        (X).capacity = 0; \
    } while (0)
```

Initialises a vector X of the type T. The user must call VectorFree(X) after the use of X.

Parameters

X	the vector object.

Definition at line 113 of file vector.h.

4.159.2.5 VectorFree

```
#define VectorFree(
                X )
```

Value:

```
    do { \
        M_free((X).ptr, "VectorFree:" #X); \
        (X).ptr = NULL; \
        (X).size = 0; \
        (X).capacity = 0; \
    } while (0)
```

Frees the buffer allocated by the vector X.

Parameters

X	the vector object.

Definition at line 130 of file vector.h.

4.159.2.6 VectorPtr

```
#define VectorPtr(
                X )   ((X).ptr)
```

Returns the pointer to the buffer for the vector X. NULL when VectorCapacity(X) == 0.

Parameters

X	the vector object.

Returns

the pointer to the allocated buffer for the vector.

Definition at line 150 of file vector.h.

4.159.2.7 VectorFront

```
#define VectorFront(
                X )   ((X).ptr[0])
```

Returns the first element of the vector X. Undefined when VectorSize(X) == 0.

Parameters

X	the vector object.

Returns

the first element of the vector.

Definition at line 165 of file vector.h.

4.159.2.8 VectorBack

```
#define VectorBack(
              X )   ((X).ptr[(X).size - 1])
```

Returns the last element of the vector X. Undefined when VectorSize(X) == 0.

Parameters

X	the vector object.

Returns

the last element of the vector.

Definition at line 180 of file vector.h.

4.159.2.9 VectorSize

```
#define VectorSize(
              X )   ((X).size)
```

Returns the size of the vector X.

Parameters

X	the vector object.

Returns

the size of the vector.

Definition at line 194 of file vector.h.

4.159.2.10 VectorCapacity

```
#define VectorCapacity(
              X )   ((X).capacity)
```

Returns the capacity (the number of the already allocated elements) of the vector X.

Parameters

X	the vector object.

Returns

the capacity of the vector.

Definition at line 208 of file vector.h.

4.159.2.11 VectorEmpty

```
#define VectorEmpty(
              X )  ((X).size == 0)
```

Returns true the size of the vector X is zero.

Parameters

X	the vector object.

Returns

true if the vector has no elements, false otherwise.

Definition at line 222 of file vector.h.

4.159.2.12 VectorClear

```
#define VectorClear(
              X )  do { (X).size = 0; } while (0)
```

Sets the size of the vector X to zero.

Parameters

X	the vector object.

Definition at line 235 of file vector.h.

4.159.2.13 VectorReserve

```
#define VectorReserve(
              X,
              newcapacity )
```

Value:

```
    do { \
        size_t v_tmp_newcapacity_ = (newcapacity); \
        if ( (X).capacity < v_tmp_newcapacity_ ) { \
            void *v_tmp_newptr_; \
            v_tmp_newcapacity_ = (v_tmp_newcapacity_ * 3) / 2; \
            if ( v_tmp_newcapacity_ < 4 ) v_tmp_newcapacity_ = 4; \
            v_tmp_newptr_ = Mallocl(sizeof((X).ptr[0]) * v_tmp_newcapacity_, "VectorReserve:" #X); \
            if ( (X).ptr != NULL ) { \
                memcpy(v_tmp_newptr_, (X).ptr, (X).size * sizeof((X).ptr[0])); \
                M_free((X).ptr, "VectorReserve:" #X); \
            } \
            (X).ptr = v_tmp_newptr_; \
            (X).capacity = v_tmp_newcapacity_; \
        } \
    } while (0)
```

Requires that the capacity of the vector X is equal to or lager than newcapacity.

Parameters

X	the vector object.
newcapacity	the capacity to be reserved.

Definition at line 249 of file vector.h.

4.159.2.14 VectorPushBack

```
#define VectorPushBack(
                X,
                x )
```

Value:

```
    do { \
        VectorReserve((X), (X).size + 1); \
        (X).ptr[(X).size++] = (x); \
    } while (0)
```

Adds an element x at the end of the vector X.

Parameters

X	the vector object.
x	the element to be added.

Definition at line 277 of file vector.h.

4.159.2.15 VectorPushBacks

```
#define VectorPushBacks(
                X,
                src,
                n )
```

Value:

```
    do { \
        size_t v_tmp_n_ = (n); \
        VectorReserve((X), (X).size + v_tmp_n_); \
        memcpy((X).ptr + (X).size, (src), v_tmp_n_ * sizeof((X).ptr[0])); \
        (X).size += v_tmp_n_; \
    } while (0)
```

Adds an n elements of src at the end of the vector X.

Parameters

X	the vector object.
src	the starting address of the buffer storing elements to be added.
n	the number of elements to be added.

Definition at line 295 of file vector.h.

4.159.2.16 VectorPopBack

```
#define VectorPopBack(
              X )   do { (X).size --; } while (0)
```

Removes the last element of the vector X. VectorSize(X) must be > 0.

Parameters

X	the vector object.

Definition at line 314 of file vector.h.

4.159.2.17 VectorInsert

```
#define VectorInsert(
              X,
              index,
              x )
```

Value:

```
    do { \
        size_t v_tmp_index_ = (index); \
        VectorReserve((X), (X).size + 1); \
        memmove((X).ptr + v_tmp_index_ + 1, (X).ptr + v_tmp_index_, ((X).size - v_tmp_index_) *
      sizeof((X).ptr[0])); \
        (X).ptr[v_tmp_index_] = (x); \
        (X).size++; \
    } while (0)
```

Inserts an element x at the specified index of the vector X. The index must be 0 <= index < VectorSize(X).

Parameters

X	the vector object.
index	the position at which the element will be inserted.
x	the element to be inserted.

Definition at line 330 of file vector.h.

4.159.2.18 VectorInserts

```
#define VectorInserts(
              X,
```

```
                index,
                src,
                n )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index), v_tmp_n_ = (n); \
    VectorReserve((X), (X).size + v_tmp_n_); \
    memmove((X).ptr + v_tmp_index_ + v_tmp_n_, (X).ptr + v_tmp_index_, ((X).size - v_tmp_index_) *
  sizeof((X).ptr[0])); \
    memcpy((X).ptr + v_tmp_index_, (src), v_tmp_n_ * sizeof((X).ptr[0])); \
    (X).size += v_tmp_n_; \
} while (0)
```

Inserts an n elements of src at the specified index of the vector X. The index must be 0 <= index < VectorSize(X).

Parameters

X	the vector object.
index	the position at which the elements will be inserted.
src	the starting address of the buffer storing elements to be inserted.
n	the number of elements to be inserted.

Definition at line 353 of file vector.h.

4.159.2.19 VectorErase

```
#define VectorErase(
                X,
                index )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index); \
    memmove((X).ptr + v_tmp_index_, (X).ptr + v_tmp_index_ + 1, ((X).size - v_tmp_index_ - 1) *
  sizeof((X).ptr[0])); \
    (X).size--; \
} while (0)
```

Removes an element at the specified index of the vector X. The index must be 0 <= index < VectorSize(X).

Parameters

X	the vector object.
index	the position of the element to be removed.

Definition at line 374 of file vector.h.

4.159.2.20 VectorErases

```
#define VectorErases(
                X,
                index,
                n )
```

Value:

```
do { \
    size_t v_tmp_index_ = (index), v_tmp_n_ = (n); \
    memmove((X).ptr + v_tmp_index_, (X).ptr + v_tmp_index_ + v_tmp_n_, ((X).size - v_tmp_index_ - 1) *
  sizeof((X).ptr[0])); \
    (X).size -= v_tmp_n_; \
} while (0)
```

Removes an n elements at the specified index of the vector X. The index must be 0 <= index < VectorSize(X) - n + 1.

Parameters

X	the vector object.
index	the starting position of the elements to be removed.
n	the number of elements to be removed.

Definition at line 394 of file vector.h.

4.161.1 Detailed Description

Contains the functions that deal with the wildcards. During the pattern matching there are two steps: 1: check that a wildcard substitution is correct (if there was already an assignment for this variable, it is the same; it is part of the proper set; it is the proper type of variables, etc.) 2: make the assignment In addition we have to be able to clear assignments. During execution we have to make the actual replacements (WildFill)

4.161.3 Function Documentation

4.161.3.1 WildFill()

```
WORD WildFill (
             PHEAD WORD * to,
             WORD * from,
             WORD * sub )
```

Definition at line 65 of file wildcard.c.

4.161.3.2 ResolveSet()

```
int ResolveSet (
             PHEAD WORD * from,
             WORD * to,
             WORD * subs )
```

Definition at line 1361 of file wildcard.c.

4.161.3.3 ClearWild()

```
void ClearWild (
             PHEAD0  )
```

Definition at line 1518 of file wildcard.c.

4.161.3.4 AddWild()

```
int AddWild (
              PHEAD WORD oldnumber,
              WORD type,
              WORD newnumber )
```

Definition at line 1544 of file wildcard.c.

4.161.3.5 CheckWild()

```
int CheckWild (
              PHEAD WORD oldnumber,
              WORD type,
              WORD newnumber,
              WORD * newval )
```

Definition at line 1797 of file wildcard.c.

4.161.3.6 DenToFunction()

```
int DenToFunction (
              WORD * term,
              WORD numfun )
```

Definition at line 2565 of file wildcard.c.

00047 #define DEBUG(x) x
00048
00049     #] Includes :
00050     #[ Wildcards :
00051         #[ WildFill :           WORD WildFill(to,from,sub)
00052
00053         Takes the term in from and puts it into to while
00054         making wildcard substitutions.
00055         The return value is the number of words put in to.
00056         The length as the first word of from is not copied.
00057
00058         There are two possible algorithms:
00059         1:  For each element in `from': scan sub.
00060         2:  For each wildcard in sub replace elements in term.
00061         The original algorithm used 1:

01347
```

```
01348         The set syntax is:
01349         SET,length,subterm,where,whichmember[,where,whichmember]
01350
01351         setlength is 2*n+1 with n the number of set substitutions.
01352         length = setlength + subtermlength + 2
01353
01354         At `where' is the number of the set and `whichmember' is the
01355         number of the element. This is still a symbol/dollar and we
01356         have to find the substitution in the wildcards.
01357         The output is the subterm in which the setelements have been
01358         substituted. This is ready for further wildcard substitutions.

01775           #[ CheckWild :          WORD CheckWild(oldnumber,type,newnumber,newval)
01776
01777           Tests whether a wildcard assignment is allowed.
01778           A return value of zero means that it is allowed (nihil obstat).
01779           If the variable has been assigned already its existing
01780           assignment is returned in AN.oldvalue and AN.oldtype, which are
01781           global variables.
01782
```

```
01783         Note the special problem with name?set[i]. Here we have to pass
01784         an extra assignment. This cannot be done via globals as we
01785         call CheckWild sometimes twice before calling AddWild.
01786         Trick: Check the assignment of the number and if OK put it
01787         in place, but don't alter the used flag (if needed).
01788         Then AddWild can alter the used flag but the value is there.
01789         As long as this trick is `hanging' we turn on the flag:
01790         `AN.WildReserve' which is either turned off by AddWild or by
01791         a failing call to CheckWild.
01792
01793         With ARGTOARG the tensors give the number of arguments
01794         or-ed with EATTENSOR which is at least 8192.
