Generated by Doxygen 1.9.8

Chapter 1

Data Structure Index

1.1 Data Structures

Here are the data structures with brief descriptions:

Chapter 2

File Index

2.1 File List

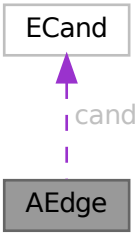
Here is a list of all documented files with brief descriptions:

Chapter 3

Data Structure Documentation

3.1 AEdge Class Reference

Collaboration diagram for AEdge:



Public Member Functions

- AEdge (int n0, int l0, int n1, int l1)

Data Fields

- ECand * cand
- int nodes [2]
- int nlegs [2]
- int ptcl
- int DUMMYPADDING

3.1.1 Detailed Description

Definition at line 1164 of file grcc.h.

3.1.2 Constructor & Destructor Documentation

3.1.2.1 AEdge()

```
AEdge::AEdge (
            int n0,
            int l0,
            int n1,
            int l1 )
```

Definition at line 8275 of file grcc.cc.

3.1.2.2 ~AEdge()

```
AEdge::~AEdge (
            void  )
```

Definition at line 8286 of file grcc.cc.

3.1.3 Field Documentation

3.1.3.1 cand

```
ECand* AEdge::cand
```

Definition at line 1171 of file grcc.h.

3.1.3.2 nodes

```
int AEdge::nodes[2]
```

Definition at line 1172 of file grcc.h.

3.1.3.3 nlegs

```
int AEdge::nlegs[2]
```

Definition at line 1173 of file grcc.h.

3.1.3.4 ptcl

```
int AEdge::ptcl
```

Definition at line 1174 of file grcc.h.

3.1.3.5 DUMMYPADDING

```
int AEdge::DUMMYPADDING
```

Definition at line 1176 of file grcc.h.

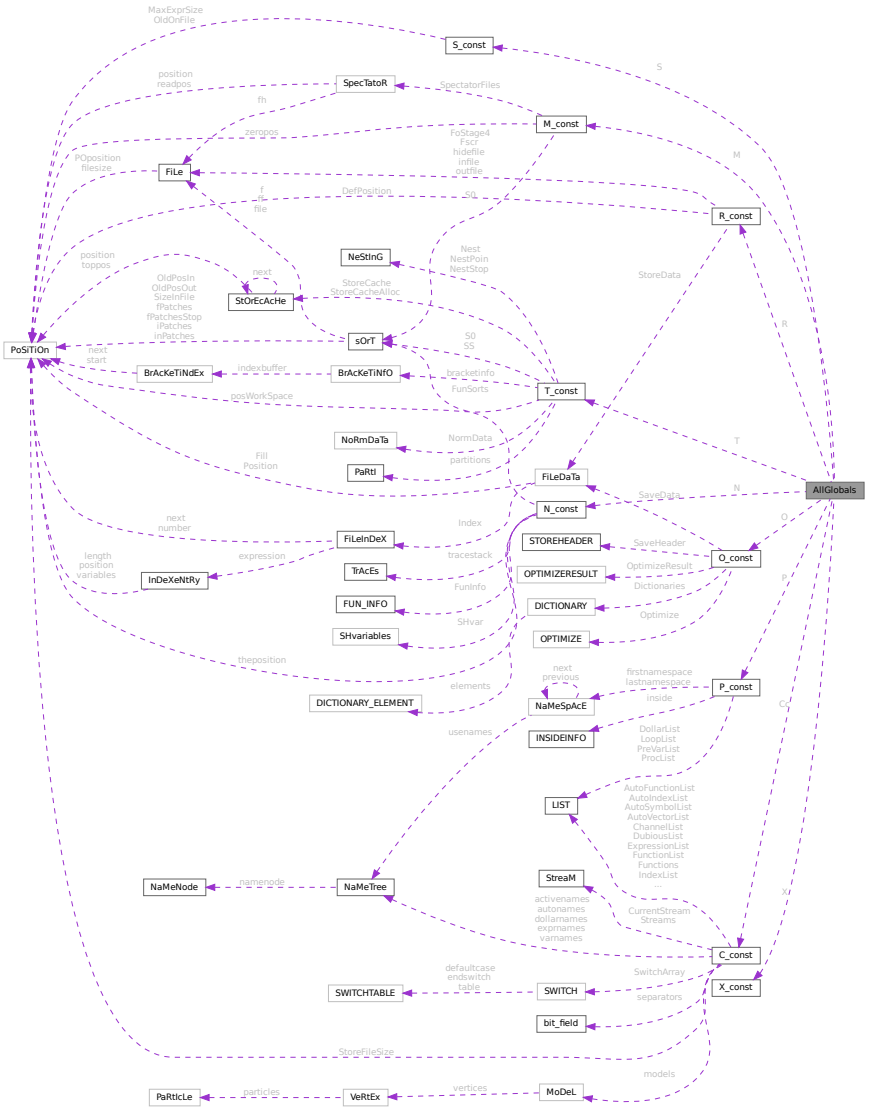
The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.2 AllGlobals Struct Reference

```
#include <structs.h>
```

Collaboration diagram for AllGlobals:



Data Fields

- struct M_const M
- struct C_const Cc
- struct S_const S
- struct R_const R
- struct N_const N
- struct O_const O
- struct P_const P
- struct T_const T
- struct X_const X

3.2.1 Detailed Description

Without pthreads (FORM) the ALLGLOBALS struct has all the global variables

Definition at line 2503 of file structs.h.

3.2.2 Field Documentation

3.2.2.1 M

```
struct M_const AllGlobals::M
```

Definition at line 2504 of file structs.h.

3.2.2.2 Cc

```
struct C_const AllGlobals::Cc
```

Definition at line 2505 of file structs.h.

3.2.2.3 S

```
struct S_const AllGlobals::S
```

Definition at line 2506 of file structs.h.

3.2.2.4 R

```
struct R_const AllGlobals::R
```

Definition at line 2507 of file structs.h.

3.2.2.5 N

```
struct N_const AllGlobals::N
```

Definition at line 2508 of file structs.h.

3.2.2.6 O

```
struct O_const AllGlobals::O
```

Definition at line 2509 of file structs.h.

3.2.2.7 P

```
struct P_const AllGlobals::P
```

Definition at line 2510 of file structs.h.

3.2.2.8 T

```
struct T_const AllGlobals::T
```

Definition at line 2511 of file structs.h.

3.2.2.9 X

```
struct X_const AllGlobals::X
```

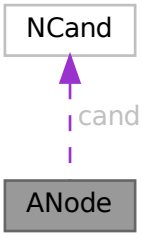
Definition at line 2512 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.3 ANode Class Reference

Collaboration diagram for ANode:



Public Member Functions

- ANode (int dg)
- int newleg (void)

Data Fields

- int deg
- int nlegs
- int * anodes
- int * aedges
- int * aelegs
- NCand * cand

3.3.1 Detailed Description

Definition at line 1140 of file grcc.h.

3.3.2 Constructor & Destructor Documentation

3.3.2.1 ANode()

```
ANode::ANode (
            int dg )
```

Definition at line 8220 of file grcc.cc.

3.3.2.2 ~ANode()

```
ANode::~ANode (
            void  )
```

Definition at line 8238 of file grcc.cc.

3.3.3 Member Function Documentation

3.3.3.1 newleg()

```
int ANode::newleg (
            void  )
```

Definition at line 8255 of file grcc.cc.

3.3.4 Field Documentation

3.3.4.1 deg

```
int ANode::deg
```

Definition at line 1150 of file grcc.h.

3.3.4.2 nlegs

```
int ANode::nlegs
```

Definition at line 1151 of file grcc.h.

3.3.4.3 anodes

```
int* ANode::anodes
```

Definition at line 1152 of file grcc.h.

3.3.4.4 aedges

```
int* ANode::aedges
```

Definition at line 1153 of file grcc.h.

3.3.4.5 aelegs

```
int* ANode::aelegs
```

Definition at line 1154 of file grcc.h.

3.3.4.6 cand

```
NCand* ANode::cand
```

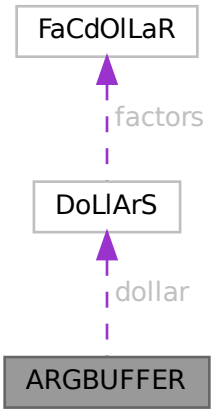
Definition at line 1155 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.4 ARGBUFFER Struct Reference

Collaboration diagram for ARGBUFFER:



Data Fields

- WORD * buffer
- DOLLARS dollar
- LONG size
- int type
- int dummy

3.4.1 Detailed Description

Definition at line 601 of file ratio.c.

3.4.2 Field Documentation

3.4.2.1 buffer

```
WORD* ARGBUFFER::buffer
```

Definition at line 602 of file ratio.c.

3.4.2.2 dollar

```
DOLLARS ARGBUFFER::dollar
```

Definition at line 603 of file ratio.c.

3.4.2.3 size

```
LONG ARGBUFFER::size
```

Definition at line 604 of file ratio.c.

3.4.2.4 type

```
int ARGBUFFER::type
```

Definition at line 605 of file ratio.c.

3.4.2.5 dummy

```
int ARGBUFFER::dummy
```

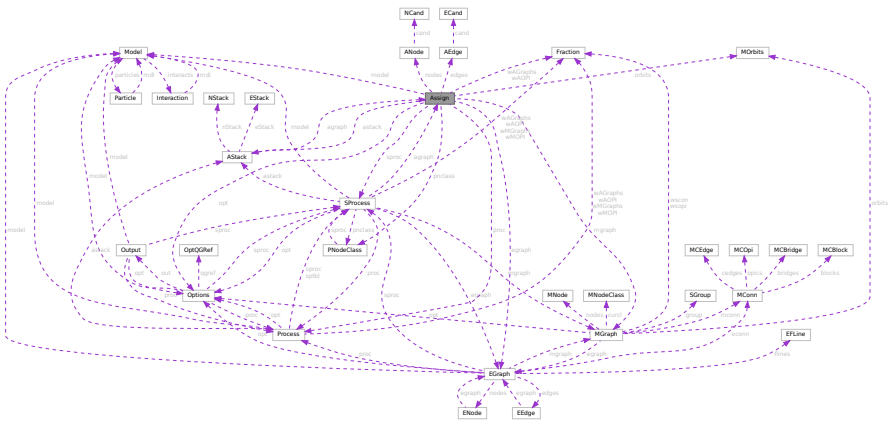
Definition at line 606 of file ratio.c.

The documentation for this struct was generated from the following file:

- ratio.c

3.5 Assign Class Reference

Collaboration diagram for Assign:



Public Member Functions

- Assign (SProcess ∗sprc, MGraph ∗mgr, PNodeClass ∗pnc)
- void prCand (const char ∗msg)
- void checkAG (const char ∗msg)
- Bool assignAllVertices (void)
- Bool selectVertex (void)
- Bool selectVertexSimp (int lastv)
- Bool selectLeg (int v, int lastlg)
- Bool assignVertex (int v)
- Bool allAssigned (void)
- Bool fromMGraph (void)
- void addEdge (int n0, int n1, int nplist, int ∗plist)
- void connect (int n0, int l0, int eg, int el, int n1, int l1)
- Bool fillEGraph (int aid, BigInt nsym, BigInt esym, BigInt nsym1)
- int ∗ reordLeg (int n, int ∗reord, int ∗plist, int ∗used)
- int getLegParticle (int n, int ln)
- int legEdgeParticle (int n, int ln, int pt)
- int legPart (int v, int lg, int nplst, int ∗plst, int ∗rlist, const int size)
- int candPart (int v, int ln, int ∗plist, const int size)
- int selUnAssVertex (void)
- int selUnAssVertexSimp (int lastv)
- int selUnAssLeg (int v, int lastlg)
- NCandSt assignIVertex (int v, int ia)
- Bool assignPLeg (int n, int ln, int pt)
- Bool isOrdPLeg (int n, int ln, int pt)
- Bool detEdge (int e)
- Bool candPartClassify (int v, int ∗npdass, int ∗pdass, int ∗npuass, int ∗puass, const int size)
- Bool updateCandNode (int v)
- Bool checkOrderCpl (void)
- Bool isOrdLegs (void)
- Bool isIsomorphic (MNodeClass ∗cl, BigInt ∗nsym, BigInt ∗esym, BigInt ∗nsym1)
- int cmpPermGraph (int ∗p, MNodeClass ∗cl)
- int cmpNodes (int nd0, int nd1, MNodeClass ∗cn)
- BigInt edgeSym (void)
- void saveCouple (int ∗sav)
- void restoreCouple (int ∗sav)
- Bool subCouple (int ∗cpl)
- Bool checkCand (const char ∗msg)
- void checkNode (int n, const char ∗msg)

Data Fields

- EGraph ∗ egraph
- MGraph ∗ mgraph
- SProcess ∗ sproc
- Process ∗ proc
- Model ∗ model
- Options ∗ opt
- AStack ∗ astack
- PNodeClass ∗ pnclass
- MOrbits ∗ orbits
- int nNodes
- int nEdges

- int nExtern
- int nETotal
- BigInt nAGraphs
- Fraction wAGraphs
- BigInt nAOPI
- Fraction wAOPI
- ANode ** nodes
- AEdge ** edges
- CheckPt checkpoint0
- int cplleft [GRCC_MAXNCPLG]

3.5.1 Detailed Description

Definition at line 1183 of file grcc.h.

3.5.2 Constructor & Destructor Documentation

3.5.2.1 Assign()

```
Assign::Assign (
            SProcess * sprc,
            MGraph * mgr,
            PNodeClass * pnc )
```

Definition at line 8295 of file grcc.cc.

3.5.2.2 ~Assign()

```
Assign::~Assign (
            void  )
```

Definition at line 8371 of file grcc.cc.

3.5.3 Member Function Documentation

3.5.3.1 prCand()

```
void Assign::prCand (
            const char * msg )
```

Definition at line 8391 of file grcc.cc.

3.5.3.2 checkAG()

```
void Assign::checkAG (
            const char * msg )
```

Definition at line 8427 of file grcc.cc.

3.5.3.3 assignAllVertices()

```
Bool Assign::assignAllVertices (
            void  )
```

Definition at line 8451 of file grcc.cc.

3.5.3.4 selectVertex()

```
Bool Assign::selectVertex (
            void  )
```

Definition at line 8514 of file grcc.cc.

3.5.3.5 selectVertexSimp()

```
Bool Assign::selectVertexSimp (
            int lastv )
```

Definition at line 8475 of file grcc.cc.

3.5.3.6 selectLeg()

```
Bool Assign::selectLeg (
            int v,
            int lastlg )
```

Definition at line 8553 of file grcc.cc.

3.5.3.7 assignVertex()

```
Bool Assign::assignVertex (
            int v )
```

Definition at line 8655 of file grcc.cc.

3.5.3.8 allAssigned()

```
Bool Assign::allAssigned (
            void  )
```

Definition at line 8778 of file grcc.cc.

3.5.3.9 fromMGraph()

```
Bool Assign::fromMGraph (
            void  )
```

Definition at line 8858 of file grcc.cc.

3.5.3.10 addEdge()

```
void Assign::addEdge (
            int n0,
            int n1,
            int nplist,
            int * plist )
```

Definition at line 9004 of file grcc.cc.

3.5.3.11 connect()

```
void Assign::connect (
            int n0,
            int l0,
            int eg,
            int el,
            int n1,
            int l1 )
```

Definition at line 9049 of file grcc.cc.

3.5.3.12 fillEGraph()

```
Bool Assign::fillEGraph (
            int aid,
            BigInt nsym,
            BigInt esym,
            BigInt nsym1 )
```

Definition at line 9078 of file grcc.cc.

3.5.3.13 reordLeg()

```
int * Assign::reordLeg (
            int n,
            int * reord,
            int * plist,
            int * used )
```

Definition at line 9218 of file grcc.cc.

3.5.3.14 getLegParticle()

```
int Assign::getLegParticle (
            int n,
            int ln )
```

Definition at line 9293 of file grcc.cc.

3.5.3.15 legEdgeParticle()

```
int Assign::legEdgeParticle (
            int n,
            int ln,
            int pt )
```

Definition at line 9320 of file grcc.cc.

3.5.3.16 legPart()

```
int Assign::legPart (
            int v,
            int lg,
            int nplst,
            int * plst,
            int * rlist,
            const int size )
```

Definition at line 9340 of file grcc.cc.

3.5.3.17 candPart()

```
int Assign::candPart (
            int v,
            int ln,
            int * plist,
            const int size )
```

Definition at line 9356 of file grcc.cc.

3.5.3.18 selUnAssVertex()

```
int Assign::selUnAssVertex (
            void  )
```

Definition at line 9409 of file grcc.cc.

3.5.3.19 selUnAssVertexSimp()

```
int Assign::selUnAssVertexSimp (
            int lastv )
```

Definition at line 9389 of file grcc.cc.

3.5.3.20 selUnAssLeg()

```
int Assign::selUnAssLeg (
            int v,
            int lastlg )
```

Definition at line 9438 of file grcc.cc.

3.5.3.21 assignIVertex()

```
NCandSt Assign::assignIVertex (
            int v,
            int ia )
```

Definition at line 9477 of file grcc.cc.

3.5.3.22 assignPLeg()

```
Bool Assign::assignPLeg (
            int n,
            int ln,
            int pt )
```

Definition at line 9523 of file grcc.cc.

3.5.3.23 isOrdPLeg()

```
Bool Assign::isOrdPLeg (
            int n,
            int ln,
            int pt )
```

Definition at line 9596 of file grcc.cc.

3.5.3.24 detEdge()

```
Bool Assign::detEdge (
            int e )
```

Definition at line 9575 of file grcc.cc.

3.5.3.25 candPartClassify()

```
Bool Assign::candPartClassify (
            int v,
            int * npdass,
            int * pdass,
            int * npuass,
            int * puass,
            const int size )
```

Definition at line 9640 of file grcc.cc.

3.5.3.26 updateCandNode()

```
Bool Assign::updateCandNode (
            int v )
```

Definition at line 9677 of file grcc.cc.

3.5.3.27 checkOrderCpl()

```
Bool Assign::checkOrderCpl (
            void  )
```

Definition at line 9816 of file grcc.cc.

3.5.3.28 isOrdLegs()

```
Bool Assign::isOrdLegs (
            void  )
```

Definition at line 9854 of file grcc.cc.

3.5.3.29 isIsomorphic()

```
Bool Assign::isIsomorphic (
            MNodeClass * cl,
            BigInt * nsym,
            BigInt * esym,
            BigInt * nsym1 )
```

Definition at line 9892 of file grcc.cc.

3.5.3.30 cmpPermGraph()

```
int Assign::cmpPermGraph (
            int * p,
            MNodeClass * cl )
```

Definition at line 9968 of file grcc.cc.

3.5.3.31 cmpNodes()

```
int Assign::cmpNodes (
            int nd0,
            int nd1,
            MNodeClass * cn )
```

Definition at line 10050 of file grcc.cc.

3.5.3.32 edgeSym()

```
BigInt Assign::edgeSym (
            void  )
```

Definition at line 10070 of file grcc.cc.

3.5.3.33 saveCouple()

```
void Assign::saveCouple (
            int * sav )
```

Definition at line 8615 of file grcc.cc.

3.5.3.34 restoreCouple()

```
void Assign::restoreCouple (
            int * sav )
```

Definition at line 8627 of file grcc.cc.

3.5.3.35 subCouple()

```
Bool Assign::subCouple (
            int * cpl )
```

Definition at line 8639 of file grcc.cc.

3.5.3.36 checkCand()

```
Bool Assign::checkCand (
            const char * msg )
```

Definition at line 10129 of file grcc.cc.

3.5.3.37 checkNode()

```
void Assign::checkNode (
            int n,
            const char * msg )
```

Definition at line 10201 of file grcc.cc.

3.5.4 Field Documentation

3.5.4.1 egraph

```
EGraph* Assign::egraph
```

Definition at line 1188 of file grcc.h.

3.5.4.2 mgraph

```
MGraph* Assign::mgraph
```

Definition at line 1189 of file grcc.h.

3.5.4.3 sproc

```
SProcess* Assign::sproc
```

Definition at line 1190 of file grcc.h.

3.5.4.4 proc

```
Process* Assign::proc
```

Definition at line 1191 of file grcc.h.

3.5.4.5 model

```
Model* Assign::model
```

Definition at line 1192 of file grcc.h.

3.5.4.6 opt

```
Options* Assign::opt
```

Definition at line 1193 of file grcc.h.

3.5.4.7 astack

```
AStack* Assign::astack
```

Definition at line 1194 of file grcc.h.

3.5.4.8 pnclass

```
PNodeClass* Assign::pnclass
```

Definition at line 1195 of file grcc.h.

3.5.4.9 orbits

```
MOrbits* Assign::orbits
```

Definition at line 1196 of file grcc.h.

3.5.4.10 nNodes

```
int Assign::nNodes
```

Definition at line 1198 of file grcc.h.

3.5.4.11 nEdges

```
int Assign::nEdges
```

Definition at line 1199 of file grcc.h.

3.5.4.12 nExtern

```
int Assign::nExtern
```

Definition at line 1200 of file grcc.h.

3.5.4.13 nETotal

```
int Assign::nETotal
```

Definition at line 1201 of file grcc.h.

3.5.4.14 nAGraphs

```
BigInt Assign::nAGraphs
```

Definition at line 1203 of file grcc.h.

3.5.4.15 wAGraphs

```
Fraction Assign::wAGraphs
```

Definition at line 1204 of file grcc.h.

3.5.4.16 nAOPI

```
BigInt Assign::nAOPI
```

Definition at line 1205 of file grcc.h.

3.5.4.17 wAOPI

```
Fraction Assign::wAOPI
```

Definition at line 1206 of file grcc.h.

3.5.4.18 nodes

```
ANode** Assign::nodes
```

Definition at line 1208 of file grcc.h.

3.5.4.19 edges

```
AEdge** Assign::edges
```

Definition at line 1209 of file grcc.h.

3.5.4.20 checkpoint0

```
CheckPt Assign::checkpoint0
```

Definition at line 1211 of file grcc.h.

3.5.4.21 cplleft

```
int Assign::cplleft[GRCC_MAXNCPLG]
```

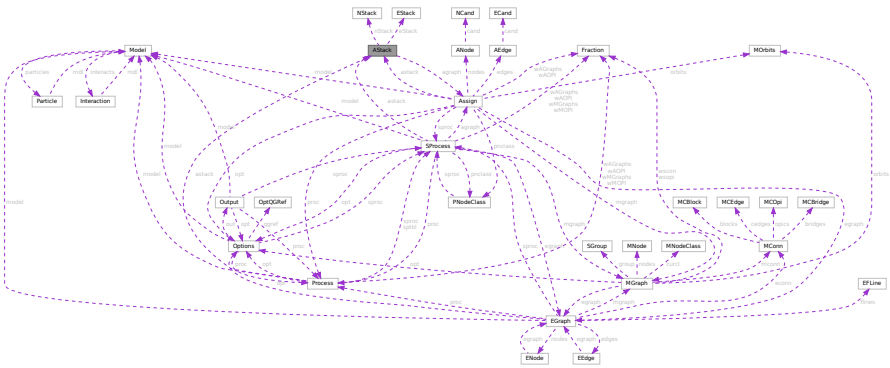
Definition at line 1213 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.6 AStack Class Reference

Collaboration diagram for AStack:



Public Member Functions

- AStack (int nSize, int eSize)
- void setAGraph (Assign ∗ag)
- void checkPoint (CheckPt sav)
- void restore (CheckPt sav)
- void restoreMsg (CheckPt sav, const char ∗msg)
- void prStack (void)
- void pushNode (int n)
- void pushEdge (int e)

Data Fields

- Assign ∗ agraph
- NStack ∗∗ nStack
- int nStackP
- int nSize
- EStack ∗∗ eStack
- int eStackP
- int eSize

3.6.1 Detailed Description

Definition at line 1367 of file grcc.h.

3.6.2 Constructor & Destructor Documentation

3.6.2.1 AStack()

```
AStack::AStack (
            int nSize,
            int eSize )
```

Definition at line 10240 of file grcc.cc.

3.6.2.2 ∼AStack()

```
AStack::~AStack (
            void  )
```

Definition at line 10272 of file grcc.cc.

3.6.3 Member Function Documentation

3.6.3.1 setAGraph()

```
void AStack::setAGraph (
            Assign * ag )
```

Definition at line 10300 of file grcc.cc.

3.6.3.2 checkPoint()

```
void AStack::checkPoint (
            CheckPt sav )
```

Definition at line 10365 of file grcc.cc.

3.6.3.3 restore()

```
void AStack::restore (
            CheckPt sav )
```

Definition at line 10409 of file grcc.cc.

3.6.3.4 restoreMsg()

```
void AStack::restoreMsg (
            CheckPt sav,
            const char * msg )
```

Definition at line 10417 of file grcc.cc.

3.6.3.5 prStack()

```
void AStack::prStack (
            void  )
```

Definition at line 10432 of file grcc.cc.

3.6.3.6 pushNode()

```
void AStack::pushNode (
            int n )
```

Definition at line 10306 of file grcc.cc.

3.6.3.7 pushEdge()

```
void AStack::pushEdge (
            int e )
```

Definition at line 10336 of file grcc.cc.

3.6.4 Field Documentation

3.6.4.1 agraph

```
Assign* AStack::agraph
```

Definition at line 1371 of file grcc.h.

3.6.4.2 nStack

```
NStack** AStack::nStack
```

Definition at line 1373 of file grcc.h.

3.6.4.3 nStackP

```

- grcc.cc

3.7 bit_field Struct Reference

```
#include <structs.h>
```

Data Fields

- UBYTE bit_0: 1
- UBYTE bit_1: 1
- UBYTE bit_2: 1
- UBYTE bit_3: 1
- UBYTE bit_4: 1
- UBYTE bit_5: 1
- UBYTE bit_6: 1
- UBYTE bit_7: 1

3.7.1 Detailed Description

The struct bit_field is used by set_in, set_set, set_del and set_sub. They in turn are used in pre.c to toggle bits that indicate whether a character can be used as a separator of function arguments. This facility is used in the communication with external channels.

Definition at line 905 of file structs.h.

3.7.2 Field Documentation

3.7.2.1 bit_0

```
UBYTE bit_field::bit_0
```

Definition at line 906 of file structs.h.

3.7.2.2 bit_1

```
UBYTE bit_field::bit_1
```

Definition at line 907 of file structs.h.

3.7.2.3 bit_2

```
UBYTE bit_field::bit_2
```

Definition at line 908 of file structs.h.

3.7.2.4 bit_3

```
UBYTE bit_field::bit_3
```

Definition at line 909 of file structs.h.

3.7.2.5 bit_4

```
UBYTE bit_field::bit_4
```

Definition at line 910 of file structs.h.

3.7.2.6 bit_5

```
UBYTE bit_field::bit_5
```

Definition at line 911 of file structs.h.

3.7.2.7 bit_6

```
UBYTE bit_field::bit_6
```

Definition at line 912 of file structs.h.

3.7.2.8 bit_7

```
UBYTE bit_field::bit_7
```

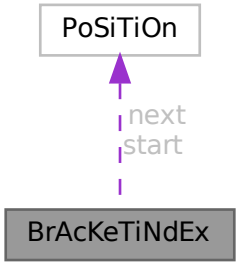
Definition at line 913 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.8 BrAcKeTiNdEx Struct Reference

Collaboration diagram for BrAcKeTiNdEx:



Data Fields

- POSITION start
- POSITION next
- LONG bracket
- LONG termsinbracket

3.8.1 Detailed Description

Definition at line 311 of file structs.h.

3.8.2 Field Documentation

3.8.2.1 start

```
POSITION BrAcKeTiNdEx::start
```

Definition at line 312 of file structs.h.

3.8.2.2 next

```
POSITION BrAcKeTiNdEx::next
```

Definition at line 313 of file structs.h.

3.8.2.3 bracket

```
LONG BrAcKeTiNdEx::bracket
```

Definition at line 314 of file structs.h.

3.8.2.4 termsinbracket

```
LONG BrAcKeTiNdEx::termsinbracket
```

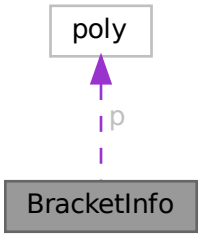
Definition at line 315 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.9 BracketInfo Struct Reference

Collaboration diagram for BracketInfo:



Public Member Functions

- BracketInfo (const std::vector< int > &pattern, int num_terms, const poly *p)
- bool operator< (const BracketInfo &rhs) const

Data Fields

- std::vector< int > pattern
- int num_terms
- int dummy = 0
- const poly * p

3.9.1 Detailed Description

Definition at line 1389 of file polygcd.cc.

3.9.2 Constructor & Destructor Documentation

3.9.2.1 BracketInfo()

```
BracketInfo::BracketInfo (
            const std::vector< int > & pattern,
            int num_terms,
            const poly * p )  [inline]
```

Definition at line 1394 of file polygcd.cc.

3.9.3 Member Function Documentation

3.9.3.1 operator<()

```
bool BracketInfo::operator< (
            const BracketInfo & rhs ) const  [inline]
```

Definition at line 1395 of file polygcd.cc.

3.9.4 Field Documentation

3.9.4.1 pattern

```
std::vector<int> BracketInfo::pattern
```

Definition at line 1390 of file polygcd.cc.

3.9.4.2 num_terms

```
int BracketInfo::num_terms
```

Definition at line 1391 of file polygcd.cc.

3.9.4.3 dummy

```
int BracketInfo::dummy = 0
```

Definition at line 1391 of file polygcd.cc.

3.9.4.4 p

```
const poly* BracketInfo::p
```

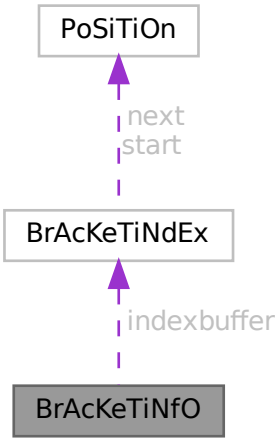
Definition at line 1392 of file polygcd.cc.

The documentation for this struct was generated from the following file:

- polygcd.cc

3.10 BrAcKeTiNfO Struct Reference

Collaboration diagram for BrAcKeTiNfO:



Data Fields

- BRACKETINDEX * indexbuffer
- WORD * bracketbuffer
- LONG bracketbuffersize
- LONG indexbuffersize
- LONG bracketfill
- LONG indexfill
- WORD SortType

3.10.1 Detailed Description

Definition at line 322 of file structs.h.

3.10.2 Field Documentation

3.10.2.1 indexbuffer

```
BRACKETINDEX* BrAcKeTiNfO::indexbuffer
```

[D]

Definition at line 323 of file structs.h.

Referenced by DoRecovery(), and FlushOut().

3.10.2.2 bracketbuffer

```
WORD* BrAcKeTiNfO::bracketbuffer
```

[D]

Definition at line 324 of file structs.h.

Referenced by DoRecovery().

3.10.2.3 bracketbuffersize

```
LONG BrAcKeTiNfO::bracketbuffersize
```

Definition at line 325 of file structs.h.

3.10.2.4 indexbuffersize

```
LONG BrAcKeTiNfO::indexbuffersize
```

Definition at line 326 of file structs.h.

3.10.2.5 bracketfill

```
LONG BrAcKeTiNfO::bracketfill
```

Definition at line 327 of file structs.h.

3.10.2.6 indexfill

```
LONG BrAcKeTiNfO::indexfill
```

Definition at line 328 of file structs.h.

3.10.2.7 SortType

```
WORD BrAcKeTiNfO::SortType
```

The sorting criterium used (like POWERFIRST etc)

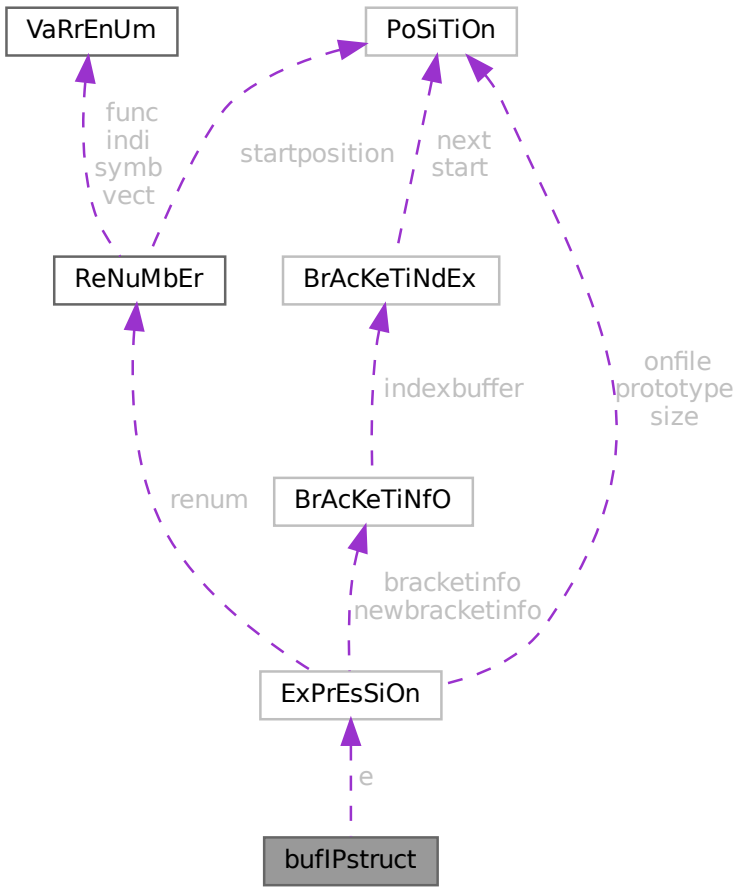
Definition at line 329 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.11 buflPstruct Struct Reference

Collaboration diagram for buflPstruct:



Data Fields

- LONG i
- struct ExPrEsSiOn e

3.11.1 Detailed Description

Definition at line 3928 of file parallel.c.

3.11.2 Field Documentation

3.11.2.1 i

```
LONG bufIPstruct::i
```

Definition at line 3929 of file parallel.c.

3.11.2.2 e

```
struct ExPrEsSiOn bufIPstruct::e
```

Definition at line 3930 of file parallel.c.

The documentation for this struct was generated from the following file:

- parallel.c

3.12 C_const Struct Reference

3.12.1 Detailed Description

The C_const struct is part of the global data and resides in the ALLGLOBALS struct A under the name #C. We see it used with the macro AC as in AC.exprnames. It contains variables that involve the compiler and objects set during compilation.

Definition at line 1679 of file structs.h.

3.12.2 Field Documentation

3.12.2.1 separators

```
set_of_char C_const::separators
```

Separators in #call and #do

Definition at line 1680 of file structs.h.

3.12.2.2 StoreFileSize

```
POSITION C_const::StoreFileSize
```

Definition at line 1681 of file structs.h.

3.12.2.3 dollarnames

```
NAMETREE* C_const::dollarnames
```

[D] Names of dollar variables

Definition at line 1682 of file structs.h.

3.12.2.4 exprnames

```
NAMETREE* C_const::exprnames
```

[D] Names of expressions

Definition at line 1683 of file structs.h.

3.12.2.5 varnames

```
NAMETREE* C_const::varnames
```

[D] Names of regular variables

Definition at line 1684 of file structs.h.

3.12.2.6 ChannelList

```
LIST C_const::ChannelList
```

Used for the #write statement. Contains CHANNEL

Definition at line 1685 of file structs.h.

3.12.2.7 DubiousList

```
LIST C_const::DubiousList
```

List of dubious variables. Contains DUBIOUSV. If not empty -> no execution

Definition at line 1687 of file structs.h.

3.12.2.8 FunctionList

```
LIST C_const::FunctionList
```

List of functions and properties. Contains FUNCTIONS

Definition at line 1689 of file structs.h.

3.12.2.9 ExpressionList

```
LIST C_const::ExpressionList
```

List of expressions, locations etc.

Definition at line 1690 of file structs.h.

3.12.2.10 IndexList

```
LIST C_const::IndexList
```

List of indices

Definition at line 1691 of file structs.h.

3.12.2.11 SetElementList

```
LIST C_const::SetElementList
```

List of all elements of all sets

Definition at line 1692 of file structs.h.

3.12.2.12 SetList

```
LIST C_const::SetList
```

List of the sets

Definition at line 1693 of file structs.h.

3.12.2.13 SymbolList

```
LIST C_const::SymbolList
```

List of the symbols and their properties

Definition at line 1694 of file structs.h.

3.12.2.14 VectorList

```
LIST C_const::VectorList
```

List of the vectors

Definition at line 1695 of file structs.h.

3.12.2.15 PotModDolList

```
LIST C_const::PotModDolList
```

Potentially changed dollars

Definition at line 1696 of file structs.h.

3.12.2.16 ModOptDolList

```
LIST C_const::ModOptDolList
```

Module Option Dollars list

Definition at line 1697 of file structs.h.

3.12.2.17 TableBaseList

```
LIST C_const::TableBaseList
```

TableBase list

Definition at line 1698 of file structs.h.

3.12.2.18 cbufList

```
LIST C_const::cbufList
```

List of compiler buffers

Definition at line 1702 of file structs.h.

3.12.2.19 AutoSymbolList

```
LIST C_const::AutoSymbolList
```

Definition at line 1706 of file structs.h.

3.12.2.20 AutoIndexList

```
LIST C_const::AutoIndexList
```

Definition at line 1707 of file structs.h.

3.12.2.21 AutoVectorList

```
LIST C_const::AutoVectorList
```

Definition at line 1708 of file structs.h.

3.12.2.22 AutoFunctionList

```
LIST C_const::AutoFunctionList
```

Definition at line 1709 of file structs.h.

3.12.2.23 autonames

```
NAMETREE* C_const::autonames
```

[D] Names in autodeclare

Definition at line 1710 of file structs.h.

3.12.2.24 Symbols

```
LIST* C_const::Symbols
```

Definition at line 1712 of file structs.h.

3.12.2.25 Indices

```
LIST* C_const::Indices
```

Definition at line 1714 of file structs.h.

3.12.2.26 Vectors

```
LIST* C_const::Vectors
```

Definition at line 1715 of file structs.h.

3.12.2.27 Functions

```
LIST* C_const::Functions
```

Definition at line 1716 of file structs.h.

3.12.2.28 activenames

```
NAMETREE** C_const::activenames
```

Definition at line 1717 of file structs.h.

3.12.2.29 Streams

```
STREAM* C_const::Streams
```

(C) Pointer for AutoDeclare statement. Points either to varnames or autonames. [D] The input streams.

Definition at line 1719 of file structs.h.

3.12.2.30 CurrentStream

```
STREAM* C_const::CurrentStream
```

(C) The current input stream. Streams are: do loop, file, prevariable. points into Streams memory.

Definition at line 1720 of file structs.h.

3.12.2.31 SwitchArray

```
SWITCH* C_const::SwitchArray
```

Definition at line 1722 of file structs.h.

3.12.2.32 models

```
MODEL** C_const::models
```

Definition at line 1723 of file structs.h.

3.12.2.33 SwitchHeap

```
WORD* C_const::SwitchHeap
```

Definition at line 1724 of file structs.h.

3.12.2.34 termstack

```
LONG* C_const::termstack
```

[D] Last term statement {offset}

Definition at line 1725 of file structs.h.

3.12.2.35 termsortstack

```
LONG* C_const::termsortstack
```

[D] Last sort statement {offset}

Definition at line 1726 of file structs.h.

3.12.2.36 cmod

```
UWORD* C_const::cmod
```

[D] Local setting of modulus. Pointer to value.

Definition at line 1727 of file structs.h.

3.12.2.37 powmod

```
UWORD* C_const::powmod
```

Local setting printing as powers. Points into cmod memory

Definition at line 1728 of file structs.h.

3.12.2.38 modpowers

```
UWORD* C_const::modpowers
```

[D] The conversion table for mod-> powers.

Definition at line 1729 of file structs.h.

3.12.2.39 halfmod

```
UWORD* C_const::halfmod
```

Definition at line 1730 of file structs.h.

3.12.2.40 ProtoType

```
WORD* C_const::ProtoType
```

Definition at line 1731 of file structs.h.

3.12.2.41 WildC

```
WORD* C_const::WildC
```

Definition at line 1732 of file structs.h.

3.12.2.42 IfHeap

```
LONG* C_const::IfHeap
```

[D] Keeps track of where to go in if

Definition at line 1733 of file structs.h.

3.12.2.43 IfCount

```
LONG* C_const::IfCount
```

[D] Keeps track of where to go in if

Definition at line 1734 of file structs.h.

3.12.2.44 IfStack

```
LONG* C_const::IfStack
```

Keeps track of where to go in if. Points into IfHeap-memory

Definition at line 1735 of file structs.h.

3.12.2.45 iBuffer

```
UBYTE* C_const::iBuffer
```

[D] Compiler input buffer

Definition at line 1736 of file structs.h.

3.12.2.46 iPointer

```
UBYTE* C_const::iPointer
```

Running pointer in the compiler input buffer

Definition at line 1737 of file structs.h.

3.12.2.47 iStop

```
UBYTE* C_const::iStop
```

Top of iBuffer

Definition at line 1738 of file structs.h.

3.12.2.48 LabelNames

```
UBYTE** C_const::LabelNames
```

[D] List of names in label statements

Definition at line 1739 of file structs.h.

3.12.2.49 FixIndices

```
WORD* C_const::FixIndices
```

[D] Buffer of fixed indices

Definition at line 1740 of file structs.h.

3.12.2.50 termsumcheck

```
WORD* C_const::termsumcheck
```

[D] Checking of nesting

Definition at line 1741 of file structs.h.

3.12.2.51 WildcardNames

```
UBYTE* C_const::WildcardNames
```

[D] Names of ?a variables

Definition at line 1742 of file structs.h.

3.12.2.52 Labels

```
int* C_const::Labels
```

Label information for during run. Pointer into LabelNames memory.

Definition at line 1743 of file structs.h.

3.12.2.53 tokens

```
SBYTE* C_const::tokens
```

[D] Array with tokens for tokenizer

Definition at line 1744 of file structs.h.

3.12.2.54 toptokens

```
SBYTE* C_const::toptokens
```

Top of tokens

Definition at line 1745 of file structs.h.

3.12.2.55 endoftokens

```
SBYTE* C_const::endoftokens
```

End of the actual tokens

Definition at line 1746 of file structs.h.

3.12.2.56 tokenarglevel

```
WORD* C_const::tokenarglevel
```

[D] Keeps track of function arguments

Definition at line 1747 of file structs.h.

3.12.2.57 modinverses

```
UWORD* C_const::modinverses
```

Definition at line 1748 of file structs.h.

3.12.2.58 Fortran90Kind

```
UBYTE* C_const::Fortran90Kind
```

Definition at line 1749 of file structs.h.

3.12.2.59 MultiBracketBuf

```
WORD** C_const::MultiBracketBuf
```

Definition at line 1750 of file structs.h.

3.12.2.60 extrasym

```
UBYTE* C_const::extrasym
```

Definition at line 1751 of file structs.h.

3.12.2.61 doloopstack

```
WORD* C_const::doloopstack
```

Definition at line 1752 of file structs.h.

3.12.2.62 doloopnest

```
WORD* C_const::doloopnest
```

Definition at line 1753 of file structs.h.

3.12.2.63 CheckpointRunAfter

```
char* C_const::CheckpointRunAfter
```

[D] Filename of script to be executed *before* creating the snapshot. =0 if no script shall be executed.

Definition at line 1754 of file structs.h.

3.12.2.64 CheckpointRunBefore

```
char* C_const::CheckpointRunBefore
```

[D] Filename of script to be executed *after* having created the snapshot. =0 if no script shall be executed.

Definition at line 1756 of file structs.h.

3.12.2.65 IfSumCheck

```
WORD* C_const::IfSumCheck
```

[D] Keeps track of if-nesting

Definition at line 1758 of file structs.h.

3.12.2.66 CommuteInSet

```
WORD* C_const::CommuteInSet
```

Definition at line 1759 of file structs.h.

3.12.2.67 TestValue

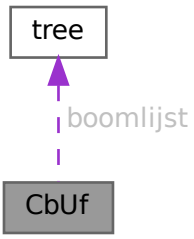
3.13 CbUf Struct Reference

`#include <structs.h>`

Collaboration diagram for CbUf:



Data Fields

- WORD * Buffer
- WORD * Top
- WORD * Pointer
- WORD ** lhs
- WORD ** rhs
- LONG * CanCommu
- LONG * NumTerms
- WORD * numdum
- WORD * dimension
- COMPTREE * boomlijst
- LONG BufferSize
- int numlhs
- int numrhs
- int maxlhs
- int maxrhs
- int mnumlhs
- int mnumrhs
- int numtree
- int rootnum
- int MaxTreeSize

3.13.1 Detailed Description

The CBUF struct is used by the compiler. It is a compiler buffer of which since version 3.0 there can be many.

Definition at line 970 of file structs.h.

3.13.2 Field Documentation

3.13.2.1 Buffer

```
WORD* CbUf::Buffer
```

[D] Size in BufferSize

Definition at line 971 of file structs.h.

Referenced by CleanupArgCache(), clearcbuf(), DoubleCbuffer(), finishcbuf(), inicbufs(), PF_BroadcastCBuf(), and Processor().

3.13.2.2 Top

```
WORD* CbUf::Top
```

pointer to the end of the Buffer memory

Definition at line 972 of file structs.h.

Referenced by AddNtoC(), AddNtoL(), DoubleCbuffer(), finishcbuf(), inicbufs(), and PF_BroadcastCBuf().

3.13.2.3 Pointer

```
WORD* CbUf::Pointer
```

pointer into the Buffer memory

Definition at line 973 of file structs.h.

Referenced by AddLHS(), AddNtoC(), AddNtoL(), AddRHS(), CleanupArgCache(), clearcbuf(), DoubleCbuffer(), finishcbuf(), Generator(), inicbufs(), PF_BroadcastCBuf(), and Processor().

3.13.2.4 lhs

```
WORD** CbUf::lhs
```

[D] Size in maxlhs. list of pointers into Buffer.

Definition at line 974 of file structs.h.

Referenced by AddLHS(), DoubleCbuffer(), finishcbuf(), Generator(), inicbufs(), PF_BroadcastCBuf(), Processor(), and TestMatch().

3.13.2.5 rhs

```
WORD** CbUf::rhs
```

[D] Size in maxrhs. list of pointers into Buffer.

Definition at line 975 of file structs.h.

Referenced by AddRHS(), CleanupArgCache(), clearcbuf(), DoubleCbuffer(), finishcbuf(), Generator(), inicbufs(), IniFbuffer(), PF_BroadcastCBuf(), and Processor().

3.13.2.6 CanCommu

```
LONG* CbUf::CanCommu
```

points into rhs memory behind WORD* area.

Definition at line 976 of file structs.h.

Referenced by AddRHS(), finishcbuf(), inicbufs(), IniFbuffer(), and PF_BroadcastCBuf().

3.13.2.7 NumTerms

```
LONG* CbUf::NumTerms
```

points into rhs memory behind CanCommu area

Definition at line 977 of file structs.h.

Referenced by AddRHS(), finishcbuf(), inicbufs(), IniFbuffer(), and PF_BroadcastCBuf().

3.13.2.8 numdum

```
WORD* CbUf::numdum
```

points into rhs memory behind NumTerms

Definition at line 978 of file structs.h.

Referenced by AddRHS(), inicbufs(), IniFbuffer(), and PF_BroadcastCBuf().

3.13.2.9 dimension

```
WORD* CbUf::dimension
```

points into rhs memory behind numdum

Definition at line 979 of file structs.h.

Referenced by AddRHS(), inicbufs(), IniFbuffer(), and PF_BroadcastCBuf().

3.13.2.10 boomlijst

```
COMPTREE* CbUf::boomlijst
```

[D] Number elements in MaxTreeSize

Definition at line 980 of file structs.h.

Referenced by CleanupArgCache(), clearcbuf(), finishcbuf(), inicbufs(), IniFbuffer(), and PF_BroadcastCBuf().

3.13.2.11 BufferSize

```
LONG CbUf::BufferSize
```

Number of allocated WORD's in Buffer

Definition at line 981 of file structs.h.

Referenced by DoubleCbuffer(), finishcbuf(), inicbufs(), and PF_BroadcastCBuf().

3.13.2.12 numlhs

```
int CbUf::numlhs
```

Definition at line 982 of file structs.h.

3.13.2.13 numrhs

```
int CbUf::numrhs
```

Definition at line 983 of file structs.h.

3.13.2.14 maxlhs

```
int CbUf::maxlhs
```

Definition at line 984 of file structs.h.

3.13.2.15 maxrhs

```
int CbUf::maxrhs
```

Definition at line 985 of file structs.h.

3.13.2.16 mnumlhs

```
int CbUf::mnumlhs
```

Definition at line 986 of file structs.h.

3.13.2.17 mnumrhs

```
int CbUf::mnumrhs
```

Definition at line 987 of file structs.h.

3.13.2.18 numtree

```
int CbUf::numtree
```

Definition at line 988 of file structs.h.

3.13.2.19 rootnum

```
int CbUf::rootnum
```

Definition at line 989 of file structs.h.

3.13.2.20 MaxTreeSize

```
int CbUf::MaxTreeSize
```

Definition at line 990 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.14 ChAnNeL Struct Reference

```
#include <structs.h>
```

Data Fields

- char * name
- int handle

3.14.1 Detailed Description

When we read input from text files we have to remember not only their handle but also their name. This is needed for error messages. Hence we call such a file a channel and reserve a struct of type CHANNEL to allow to lay this link.

Definition at line 1000 of file structs.h.

3.14.2 Field Documentation

3.14.2.1 name

```
char* ChAnNeL::name
```

[D] Name of the channel

Definition at line 1001 of file structs.h.

3.14.2.2 handle

```
int ChAnNeL::handle
```

File handle

Definition at line 1002 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.15 COST Struct Reference

Data Fields

- LONG add
- LONG mul
- LONG div
- LONG pow

3.15.1 Detailed Description

Definition at line 1271 of file structs.h.

3.15.2 Field Documentation

3.15.2.1 add

```
LONG COST::add
```

Definition at line 1272 of file structs.h.

3.15.2.2 mul

```
LONG COST::mul
```

Definition at line 1273 of file structs.h.

3.15.2.3 div

```
LONG COST::div
```

Definition at line 1274 of file structs.h.

3.15.2.4 pow

```
LONG COST::pow
```

Definition at line 1275 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.16 CSEEq Struct Reference

Public Member Functions

- bool operator() (const vector< WORD > &lhs, const vector< WORD > &rhs) const

3.16.1 Detailed Description

Definition at line 1059 of file optimize.cc.

3.16.2 Member Function Documentation

3.16.2.1 operator()()

```
bool CSEEq::operator() (
            const vector< WORD > & lhs,
            const vector< WORD > & rhs ) const  [inline]
```

Definition at line 1060 of file optimize.cc.

The documentation for this struct was generated from the following file:

- optimize.cc

3.17 CSEHash Struct Reference

Public Member Functions

- size_t operator() (const vector< WORD > &n) const

3.17.1 Detailed Description

Definition at line 1053 of file optimize.cc.

3.17.2 Member Function Documentation

3.17.2.1 operator()()

```
size_t CSEHash::operator() (
            const vector< WORD > & n ) const  [inline]
```

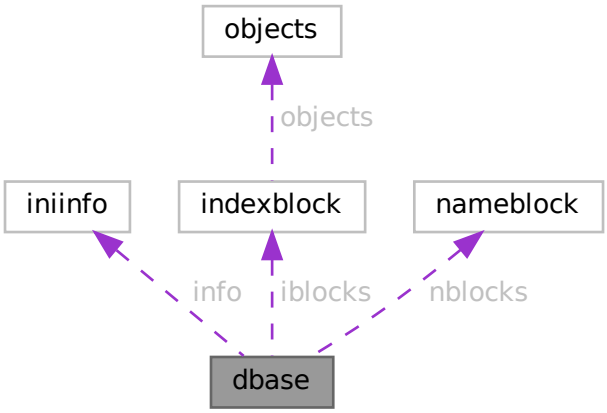
Definition at line 1054 of file optimize.cc.

The documentation for this struct was generated from the following file:

- optimize.cc

3.18 dbase Struct Reference

Collaboration diagram for dbase:



Data Fields

- INIINFO info
- MLONG mode
- MLONG tablenamessize
- MLONG topnumber
- MLONG tablenamefill
- MLONG rwmode
- INDEXBLOCK ** iblocks
- NAMESBLOCK ** nblocks
- FILE * handle
- char * name
- char * fullname
- char * tablenames

3.18.1 Detailed Description

Definition at line 123 of file minos.h.

3.18.2 Field Documentation

3.18.2.1 info

```
INIINFO dbase::info
```

Definition at line 124 of file minos.h.

3.18.2.2 mode

```
MLONG dbase::mode
```

Definition at line 125 of file minos.h.

3.18.2.3 tablenamessize

```
MLONG dbase::tablenamessize
```

Definition at line 126 of file minos.h.

3.18.2.4 topnumber

```
MLONG dbase::topnumber
```

Definition at line 127 of file minos.h.

3.18.2.5 tablenamefill

```
MLONG dbase::tablenamefill
```

Definition at line 128 of file minos.h.

3.18.2.6 rwmode

```
MLONG dbase::rwmode
```

Definition at line 129 of file minos.h.

3.18.2.7 iblocks

```
INDEXBLOCK** dbase::iblocks
```

Definition at line 130 of file minos.h.

3.18.2.8 nblocks

```
NAMESBLOCK** dbase::nblocks
```

Definition at line 131 of file minos.h.

3.18.2.9 handle

```
FILE* dbase::handle
```

Definition at line 132 of file minos.h.

3.18.2.10 name

```
char* dbase::name
```

Definition at line 133 of file minos.h.

3.18.2.11 fullname

```
char* dbase::fullname
```

Definition at line 134 of file minos.h.

3.18.2.12 tablenames

```
char* dbase::tablenames
```

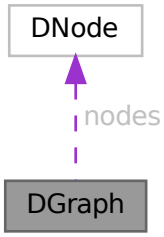
Definition at line 135 of file minos.h.

The documentation for this struct was generated from the following file:

- minos.h

3.19 DGraph Struct Reference

Collaboration diagram for DGraph:



Data Fields

- int nnodes
- int nedges
- DNode * nodes
- DEdge * edges

3.19.1 Detailed Description

Definition at line 255 of file grccparam.h.

3.19.2 Field Documentation

3.19.2.1 nnodes

```
int DGraph::nnodes
```

Definition at line 256 of file grccparam.h.

3.19.2.2 nedges

```
int DGraph::nedges
```

Definition at line 257 of file grccparam.h.

3.19.2.3 nodes

```
DNode* DGraph::nodes
```

Definition at line 258 of file grccparam.h.

3.19.2.4 edges

```
DEdge* DGraph::edges
```

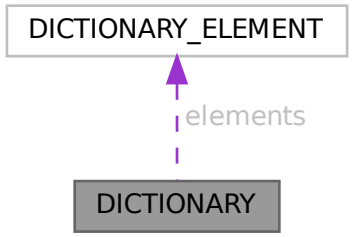
Definition at line 259 of file grccparam.h.

The documentation for this struct was generated from the following file:

- grccparam.h

3.20 DICTIONARY Struct Reference

Collaboration diagram for DICTIONARY:



Data Fields

- DICTIONARY_ELEMENT ** elements
- UBYTE * name
- int sizeelements
- int numelements
- int numbers
- int variables
- int characters
- int funwith
- int gnumelements
- int ranges

3.20.1 Detailed Description

Definition at line 1336 of file structs.h.

3.20.2 Field Documentation

3.20.2.1 elements

```
DICTIONARY_ELEMENT** DICTIONARY::elements
```

Definition at line 1337 of file structs.h.

3.20.2.2 name

```
UBYTE* DICTIONARY::name
```

Definition at line 1338 of file structs.h.

3.20.2.3 sizeelements

```
int DICTIONARY::sizeelements
```

Definition at line 1339 of file structs.h.

3.20.2.4 numelements

```
int DICTIONARY::numelements
```

Definition at line 1340 of file structs.h.

3.20.2.5 numbers

```
int DICTIONARY::numbers
```

Definition at line 1341 of file structs.h.

3.20.2.6 variables

```
int DICTIONARY::variables
```

Definition at line 1342 of file structs.h.

3.20.2.7 characters

```
int DICTIONARY::characters
```

Definition at line 1343 of file structs.h.

3.20.2.8 funwith

```
int DICTIONARY::funwith
```

Definition at line 1344 of file structs.h.

3.20.2.9 gnumelements

```
int DICTIONARY::gnumelements
```

Definition at line 1345 of file structs.h.

3.20.2.10 ranges

```
int DICTIONARY::ranges
```

Definition at line 1346 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.21 DICTIONARY_ELEMENT Struct Reference

Data Fields

- WORD * lhs
- WORD * rhs
- int type
- int size

3.21.1 Detailed Description

Definition at line 1329 of file structs.h.

3.21.2 Field Documentation

3.21.2.1 lhs

```
WORD* DICTIONARY_ELEMENT::lhs
```

Definition at line 1330 of file structs.h.

3.21.2.2 rhs

```
WORD* DICTIONARY_ELEMENT::rhs
```

Definition at line 1331 of file structs.h.

3.21.2.3 type

```
int DICTIONARY_ELEMENT::type
```

Definition at line 1332 of file structs.h.

3.21.2.4 size

```
int DICTIONARY_ELEMENT::size
```

Definition at line 1333 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.22 DiStRiBuTe Struct Reference

```
#include <structs.h>
```

Data Fields

- WORD * obj1
- WORD * obj2
- WORD * out
- WORD sign
- WORD n1
- WORD n2
- WORD n
- WORD cycle [MAXMATCH]

3.22.1 Detailed Description

The struct DISTRIBUTE is used to help the pattern matcher when matching antisymmetric tensors.

Definition at line 1079 of file structs.h.

3.22.2 Field Documentation

3.22.2.1 obj1

```
WORD* DiStRiBuTe::obj1
```

Definition at line 1080 of file structs.h.

3.22.2.2 obj2

```
WORD* DiStRiBuTe::obj2
```

Definition at line 1081 of file structs.h.

3.22.2.3 out

```
WORD* DiStRiBuTe::out
```

Definition at line 1082 of file structs.h.

3.22.2.4 sign

```
WORD DiStRiBuTe::sign
```

Definition at line 1083 of file structs.h.

3.22.2.5 n1

```
WORD DiStRiBuTe::n1
```

Definition at line 1084 of file structs.h.

3.22.2.6 n2

```
WORD DiStRiBuTe::n2
```

Definition at line 1085 of file structs.h.

3.22.2.7 n

```
WORD DiStRiBuTe::n
```

Definition at line 1086 of file structs.h.

3.22.2.8 cycle

```
WORD DiStRiBuTe::cycle[MAXMATCH]
```

Definition at line 1087 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.23 DNode Struct Reference

Data Fields

- int extloop
- int intrct

3.23.1 Detailed Description

Definition at line 248 of file grccparam.h.

3.23.2 Field Documentation

3.23.2.1 extloop

```
int DNode::extloop
```

Definition at line 249 of file grccparam.h.

3.23.2.2 intrct

```
int DNode::intrct
```

Definition at line 250 of file grccparam.h.

The documentation for this struct was generated from the following file:

- grccparam.h

3.24 dollar_buf Struct Reference

3.24.1 Detailed Description

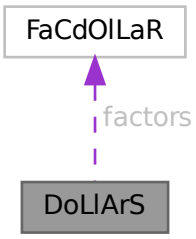
Definition at line 2483 of file parallel.c.

The documentation for this struct was generated from the following file:

- parallel.c

3.25 DoLlArS Struct Reference

Collaboration diagram for DoLlArS:



Data Fields

- WORD * where
- FACDOLLAR * factors
- LONG size
- LONG name
- WORD type
- WORD node
- WORD index
- WORD zero
- WORD numdummies
- WORD nfactors

3.25.1 Detailed Description

Definition at line 541 of file structs.h.

3.25.2 Field Documentation

3.25.2.1 where

```
WORD* DoLlArS::where
```

Definition at line 542 of file structs.h.

3.25.2.2 factors

```
FACDOLLAR* DoLlArS::factors
```

Definition at line 543 of file structs.h.

3.25.2.3 size

```
LONG DoLlArS::size
```

Definition at line 547 of file structs.h.

3.25.2.4 name

```
LONG DoLlArS::name
```

Definition at line 548 of file structs.h.

3.25.2.5 type

```
WORD DoLlArS::type
```

Definition at line 549 of file structs.h.

3.25.2.6 node

```
WORD DoLlArS::node
```

Definition at line 550 of file structs.h.

3.25.2.7 index

```
WORD DoLlArS::index
```

Definition at line 551 of file structs.h.

3.25.2.8 zero

```
WORD DoLlArS::zero
```

Definition at line 552 of file structs.h.

3.25.2.9 numdummies

```
WORD DoLlArS::numdummies
```

Definition at line 553 of file structs.h.

3.25.2.10 nfactors

```
WORD DoLlArS::nfactors
```

Definition at line 554 of file structs.h.

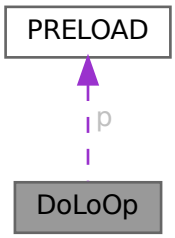
The documentation for this struct was generated from the following file:

- structs.h

3.26 DoLoOp Struct Reference

```
#include <structs.h>
```

Collaboration diagram for DoLoOp:



Data Fields

- PRELOAD p
- UBYTE * name
- UBYTE * vars
- UBYTE * contents
- UBYTE * dollarname
- LONG startlinenumber
- LONG firstnum
- LONG lastnum
- LONG incnum
- int type
- int NoShowInput
- int errorsinloop
- int firstloopcall
- WORD firstdollar
- WORD lastdollar
- WORD incdollar
- WORD NumPreTypes
- WORD PreIfLevel
- WORD PreSwitchLevel

3.26.1 Detailed Description

Each preprocessor do loop has a struct of type DOLOOP to keep track of all relevant parameters like where the beginning of the loop is, what the boundaries, increment and value of the loop parameter are, etc. Also we keep the whole loop inside a buffer of type PRELOAD

Definition at line 876 of file structs.h.

3.26.2 Field Documentation

3.26.2.1 p

```
PRELOAD DoLoOp::p
```

size, name and buffer

Definition at line 877 of file structs.h.

3.26.2.2 name

```
UBYTE* DoLoOp::name
```

pointer into PRELOAD buffer

Definition at line 878 of file structs.h.

3.26.2.3 vars

```
UBYTE* DoLoOp::vars
```

Definition at line 879 of file structs.h.

3.26.2.4 contents

```
UBYTE* DoLoOp::contents
```

Definition at line 880 of file structs.h.

3.26.2.5 dollarname

```
UBYTE* DoLoOp::dollarname
```

For loop over terms in expression. Allocated with Malloc1()

Definition at line 881 of file structs.h.

3.26.2.6 startlinenumber

```
LONG DoLoOp::startlinenumber
```

Definition at line 882 of file structs.h.

3.26.2.7 firstnum

```
LONG DoLoOp::firstnum
```

Definition at line 883 of file structs.h.

3.26.2.8 lastnum

```
LONG DoLoOp::lastnum
```

Definition at line 884 of file structs.h.

3.26.2.9 incnum

```
LONG DoLoOp::incnum
```

Definition at line 885 of file structs.h.

3.26.2.10 type

```
int DoLoOp::type
```

Definition at line 886 of file structs.h.

3.26.2.11 NoShowInput

```
int DoLoOp::NoShowInput
```

Definition at line 887 of file structs.h.

3.26.2.12 errorsinloop

```
int DoLoOp::errorsinloop
```

Definition at line 888 of file structs.h.

3.26.2.13 firstloopcall

```
int DoLoOp::firstloopcall
```

Definition at line 889 of file structs.h.

3.26.2.14 firstdollar

```
WORD DoLoOp::firstdollar
```

Definition at line 890 of file structs.h.

3.26.2.15 lastdollar

```
WORD DoLoOp::lastdollar
```

Definition at line 891 of file structs.h.

3.26.2.16 incdollar

```
WORD DoLoOp::incdollar
```

Definition at line 892 of file structs.h.

3.26.2.17 NumPreTypes

```
WORD DoLoOp::NumPreTypes
```

Definition at line 893 of file structs.h.

3.26.2.18 PrelfLevel

```
WORD DoLoOp::PreIfLevel
```

Definition at line 894 of file structs.h.

3.26.2.19 PreSwitchLevel

```
WORD DoLoOp::PreSwitchLevel
```

Definition at line 895 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.27 DuBiOuS Struct Reference

Data Fields

- LONG name
- WORD node
- WORD dummy

3.27.1 Detailed Description

Definition at line 528 of file structs.h.

3.27.2 Field Documentation

3.27.2.1 name

```
LONG DuBiOuS::name
```

Definition at line 529 of file structs.h.

3.27.2.2 node

```
WORD DuBiOuS::node
```

Definition at line 530 of file structs.h.

3.27.2.3 dummy

```
WORD DuBiOuS::dummy
```

Definition at line 531 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.28 ECand Class Reference

Public Member Functions

- ECand (int dt, int nplist, int ∗plst)
- void prECand (const char ∗msg)

Data Fields

- Bool det
- int nplist
- int plist [GRCC_MAXMPARTICLES2]

3.28.1 Detailed Description

Definition at line 1124 of file grcc.h.

3.28.2 Constructor & Destructor Documentation

3.28.2.1 ECand()

```
ECand::ECand (
            int dt,
            int nplist,
            int * plist )
```

Definition at line 8187 of file grcc.cc.

3.28.2.2 ~ECand()

```
ECand::~ECand (
            void  )
```

Definition at line 8207 of file grcc.cc.

3.28.3 Member Function Documentation

3.28.3.1 prECand()

```
void ECand::prECand (
            const char * msg )
```

Definition at line 8212 of file grcc.cc.

3.28.4 Field Documentation

3.28.4.1 det

```
Bool ECand::det
```

Definition at line 1128 of file grcc.h.

3.28.4.2 nplist

```
int ECand::nplist
```

Definition at line 1129 of file grcc.h.

3.28.4.3 plist

```
int ECand::plist[GRCC_MAXMPARTICLES2]
```

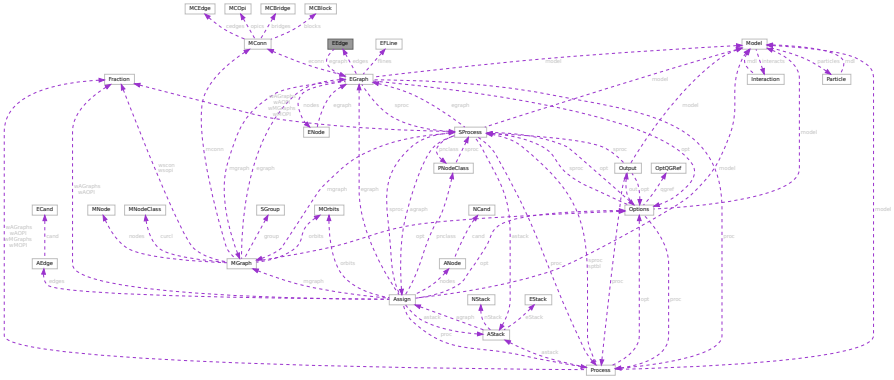
Definition at line 1130 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.29 EEdge Class Reference

Collaboration diagram for EEdge:



Public Member Functions

- EEdge (EGraph ∗egrph, int nedges, int nloops)
- void copy (EEdge ∗ee)
- void setId (EGraph ∗egrph, const int eid)
- void print (void)
- void setType (int typ)
- void setLMom (int k, int dir)
- void setEMom (int nedges, int ∗extn, int dir)

Data Fields

- EGraph ∗ egraph
- int id
- int ext
- int ptcl
- int deleted
- int nodes [2]
- int nlegs [2]
- int ∗ emom
- int ∗ lmom
- int ∗ extMom
- ULong momset
- int momdir
- Bool cut

3.31.1 Detailed Description

Definition at line 624 of file grcc.h.

3.31.2 Constructor & Destructor Documentation

3.31.2.1 EGraph()

```
EGraph::EGraph (
            int nnodes,
            int nedges,
            int mxdeg )
```

Definition at line 6328 of file grcc.cc.

3.31.2.2 ~EGraph()

```
EGraph::~EGraph (
            void  )
```

Definition at line 6388 of file grcc.cc.

3.31.3 Member Function Documentation

3.31.3.1 copy()

```
void EGraph::copy (
            EGraph * eg )
```

Definition at line 6419 of file grcc.cc.

3.31.3.2 print()

```
void EGraph::print (
            void  )
```

Definition at line 6818 of file grcc.cc.

3.31.3.3 printPy()

```
void EGraph::printPy (
            FILE * fp,
            long mId )
```

Definition at line 6884 of file grcc.cc.

3.31.3.4 fromDGraph()

```
void EGraph::fromDGraph (
            DGraph * dg )
```

Definition at line 6483 of file grcc.cc.

3.31.3.5 fromMGraph()

```
void EGraph::fromMGraph (
            MGraph * mgraph )
```

Definition at line 6589 of file grcc.cc.

3.31.3.6 optQGrafM()

```
Bool EGraph::optQGrafM (
            Options * opt )
```

Definition at line 7045 of file grcc.cc.

3.31.3.7 optQGrafA()

```
Bool EGraph::optQGrafA (
            Options * opt )
```

Definition at line 7264 of file grcc.cc.

3.31.3.8 isOptE()

```
Bool EGraph::isOptE (
            void  )
```

Definition at line 7289 of file grcc.cc.

3.31.3.9 setExtern()

```
ENode * EGraph::setExtern (
            int n0,
            int pt,
            int ndtp )
```

Definition at line 6771 of file grcc.cc.

3.31.3.10 isExternal()

```
Bool EGraph::isExternal (
            int nd )  [inline]
```

Definition at line 700 of file grcc.h.

3.31.3.11 isFermion()

```
int EGraph::isFermion (
            int nd )
```

Definition at line 7906 of file grcc.cc.

3.31.3.12 setExtLoop()

```
void EGraph::setExtLoop (
            int nd,
            int val )
```

Definition at line 6461 of file grcc.cc.

3.31.3.13 endSetExtLoop()

```
void EGraph::endSetExtLoop (
            void  )
```

Definition at line 6468 of file grcc.cc.

3.31.3.14 connComp()

```
int EGraph::connComp (
            void  )
```

Definition at line 7441 of file grcc.cc.

3.31.3.15 connVisit()

```
int EGraph::connVisit (
            int nd,
            int ncc )
```

Definition at line 7473 of file grcc.cc.

3.31.3.16 biconnE()

```
void EGraph::biconnE (
            void  )
```

Definition at line 7494 of file grcc.cc.

3.31.3.17 biinitE()

```
void EGraph::biinitE (
            void  )
```

Definition at line 7558 of file grcc.cc.

3.31.3.18 bisearchE()

```
void EGraph::bisearchE (
            int nd,
            int * extlst,
            int * intlst,
            int * opiext,
            int * opiloop )
```

Definition at line 7594 of file grcc.cc.

3.31.3.19 findRoot()

```
int EGraph::findRoot (
            void  )
```

Definition at line 7392 of file grcc.cc.

3.31.3.20 dirEdge()

```
int EGraph::dirEdge (
            int n,
            int e )
```

Definition at line 6952 of file grcc.cc.

3.31.3.21 extMomConsv()

```
void EGraph::extMomConsv (
            void  )
```

Definition at line 7799 of file grcc.cc.

3.31.3.22 cmpMom()

```
int EGraph::cmpMom (
            int * lm0,
            int * em0,
            int * lm1,
            int * em1 )
```

Definition at line 6962 of file grcc.cc.

3.31.3.23 groupLMom()

```
int EGraph::groupLMom (
            int * grp,
            int * ed2gr )
```

Definition at line 7012 of file grcc.cc.

3.31.3.24 chkMomConsv()

```
void EGraph::chkMomConsv (
            void  )
```

Definition at line 7827 of file grcc.cc.

3.31.3.25 prFLines()

```
void EGraph::prFLines (
            void  )
```

Definition at line 6939 of file grcc.cc.

3.31.3.26 getFLines()

```
void EGraph::getFLines (
            void  )
```

Definition at line 8023 of file grcc.cc.

3.31.3.27 fltrace()

```
int EGraph::fltrace (
            int fk,
            int nd0,
            int * fl )
```

Definition at line 7920 of file grcc.cc.

3.31.3.28 addFLine()

```
void EGraph::addFLine (
            const FLType ft,
            int fk,
            int nfl,
            int * fl )
```

Definition at line 8117 of file grcc.cc.

3.31.3.29 legParticle()

```
int EGraph::legParticle (
            int ed,
            int lg )
```

Definition at line 7898 of file grcc.cc.

3.31.4 Field Documentation

3.31.4.1 opt

```
Options* EGraph::opt
```

Definition at line 626 of file grcc.h.

3.31.4.2 model

```
Model* EGraph::model
```

Definition at line 627 of file grcc.h.

3.31.4.3 proc

```
Process* EGraph::proc
```

Definition at line 628 of file grcc.h.

3.31.4.4 sproc

```
SProcess* EGraph::sproc
```

Definition at line 629 of file grcc.h.

3.31.4.5 mgraph

```
MGraph* EGraph::mgraph
```

Definition at line 630 of file grcc.h.

3.31.4.6 econn

```
MConn* EGraph::econn
```

Definition at line 631 of file grcc.h.

3.31.4.7 nodes

```
ENode** EGraph::nodes
```

Definition at line 633 of file grcc.h.

3.31.4.8 edges

```
EEdge** EGraph::edges
```

Definition at line 634 of file grcc.h.

3.31.4.9 mId

```
BigInt EGraph::mId
```

Definition at line 636 of file grcc.h.

3.31.4.10 aId

```
BigInt EGraph::aId
```

Definition at line 637 of file grcc.h.

3.31.4.11 sId

```
BigInt EGraph::sId
```

Definition at line 638 of file grcc.h.

3.31.4.12 gSubId

```
BigInt EGraph::gSubId
```

Definition at line 639 of file grcc.h.

3.31.4.13 assigned

```
Bool EGraph::assigned
```

Definition at line 640 of file grcc.h.

3.31.4.14 fsign

```
int EGraph::fsign
```

Definition at line 642 of file grcc.h.

3.31.4.15 nsym

```
BigInt EGraph::nsym
```

Definition at line 643 of file grcc.h.

3.31.4.16 esym

```
BigInt EGraph::esym
```

Definition at line 643 of file grcc.h.

3.31.4.17 nsym1

```
BigInt EGraph::nsym1
```

Definition at line 644 of file grcc.h.

3.31.4.18 extperm

```
BigInt EGraph::extperm
```

Definition at line 645 of file grcc.h.

3.31.4.19 multp

```
BigInt EGraph::multp
```

Definition at line 646 of file grcc.h.

3.31.4.20 pId

```
int EGraph::pId
```

Definition at line 648 of file grcc.h.

3.31.4.21 sNodes

```
int EGraph::sNodes
```

Definition at line 650 of file grcc.h.

3.31.4.22 sEdges

```
int EGraph::sEdges
```

Definition at line 651 of file grcc.h.

3.31.4.23 sMaxdeg

```
int EGraph::sMaxdeg
```

Definition at line 652 of file grcc.h.

3.31.4.24 sLoops

```
int EGraph::sLoops
```

Definition at line 653 of file grcc.h.

3.31.4.25 nNodes

```
int EGraph::nNodes
```

Definition at line 655 of file grcc.h.

3.31.4.26 nEdges

```
int EGraph::nEdges
```

Definition at line 656 of file grcc.h.

3.31.4.27 nExtern

```
int EGraph::nExtern
```

Definition at line 657 of file grcc.h.

3.31.4.28 maxdeg

```
int EGraph::maxdeg
```

Definition at line 658 of file grcc.h.

3.31.4.29 nLoops

```
int EGraph::nLoops
```

Definition at line 659 of file grcc.h.

3.31.4.30 totalc

```
int EGraph::totalc
```

Definition at line 660 of file grcc.h.

3.31.4.31 nopicomp

```
int EGraph::nopicomp
```

Definition at line 663 of file grcc.h.

3.31.4.32 opi2plp

```
int EGraph::opi2plp
```

Definition at line 664 of file grcc.h.

3.31.4.33 nopi2p

```
int EGraph::nopi2p
```

Definition at line 665 of file grcc.h.

3.31.4.34 nadj2ptv

```
int EGraph::nadj2ptv
```

Definition at line 666 of file grcc.h.

3.31.4.35 DUMMYPADDING

```
int EGraph::DUMMYPADDING
```

Definition at line 668 of file grcc.h.

3.31.4.36 bidef

```
int* EGraph::bidef
```

Definition at line 670 of file grcc.h.

3.31.4.37 bilow

```
int* EGraph::bilow
```

Definition at line 671 of file grcc.h.

3.31.4.38 extMom

```
int* EGraph::extMom
```

Definition at line 672 of file grcc.h.

3.31.4.39 bconn

```
int EGraph::bconn
```

Definition at line 673 of file grcc.h.

3.31.4.40 bicount

```
int EGraph::bicount
```

Definition at line 674 of file grcc.h.

3.31.4.41 loopm

```
int EGraph::loopm
```

Definition at line 675 of file grcc.h.

3.31.4.42 opiCount

```
int EGraph::opiCount
```

Definition at line 676 of file grcc.h.

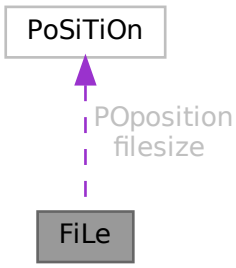
3.38 FiLe Struct Reference

```
#include <structs.h>
```

Collaboration diagram for FiLe:



Data Fields

- POSITION POposition
- POSITION filesize
- WORD * PObuffer
- WORD * POstop
- WORD * POfill
- WORD * POfull
- char * name
- ULONG numblocks
- ULONG inbuffer
- LONG POsize
- int handle
- int active

3.38.1 Detailed Description

The type FILEHANDLE is the struct that controls all relevant information of a file, whether it is open or not. The file may even not yet exist. There is a system of caches (POBuffer) and as long as the information to be written still fits inside the cache the file may never be created. There are variables that can store information about different types of files, like scratch files or sort files. Depending on what is available in the system we may also have information about gzip compression (currently sort file only) or locks (TFORM).

Definition at line 681 of file structs.h.

3.38.2 Field Documentation

3.38.2.1 POposition

```
POSITION FiLe::POposition
```

Definition at line 682 of file structs.h.

3.38.2.2 filesize

```
POSITION FiLe::filesize
```

Definition at line 683 of file structs.h.

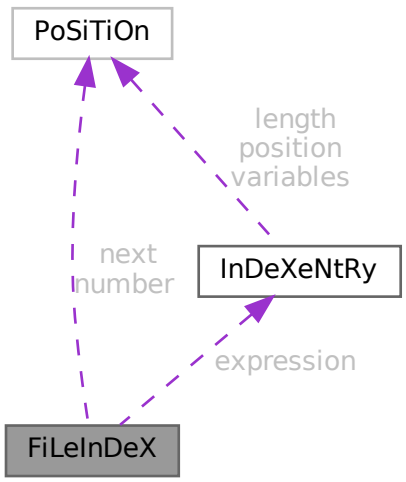
3.40 FiLeInDeX Struct Reference

```
#include <structs.h>
```

Collaboration diagram for FiLeInDeX:



Data Fields

- POSITION next
- POSITION number
- INDEXENTRY expression [INFILEINDEX]
- SBYTE empty [EMPTYININDEX]

3.40.1 Detailed Description

Defines the structure of a file index in store-files and save-files.

It contains several entries (see struct InDeXeNtRy) up to a maximum of INFILEINDEX.

The variable number has been made of type POSITION to avoid padding problems with some types of computers/↩ OS and keep system independence of the .sav files.

This struct is always 512 bytes long.

Definition at line 137 of file structs.h.

3.40.2 Field Documentation

3.40.2.1 next

```
POSITION FiLeInDeX::next
```

Position of next FILEINDEX if any

Definition at line 138 of file structs.h.

Referenced by ReadSaveIndex().

3.40.2.2 number

```
POSITION FiLeInDeX::number
```

Number of used entries in this index

Definition at line 139 of file structs.h.

Referenced by ReadSaveIndex().

3.40.2.3 expression

```
INDEXENTRY FiLeInDeX::expression[INFILEINDEX]
```

File index entries

Definition at line 140 of file structs.h.

3.40.2.4 empty

```
SBYTE FiLeInDeX::empty[EMPTYININDEX]
```

Padding to 512 bytes

Definition at line 141 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.41 FixedGlobals Struct Reference

```
#include <structs.h>
```

Data Fields

- WCN Operation [8]
- WCN2 OperaFind [6]
- char * VarType [10]
- char * ExprStat [21]
- char * FunNam [2]
- char * swmes [3]
- char * fname
- char * fname2
- UBYTE * s_one
- WORD fnamebase
- WORD fname2base
- WORD fnamesize
- WORD fname2size
- UINT cTable [256]

3.41.1 Detailed Description

The FIXEDGLOBALS struct is an anachronism. It started as the struct with global variables that needed initialization. It contains the elements Operation and OperaFind which define a very early way of automatically jumping to the proper operation. We find the results of it in parts of the file opera.c Later operations were treated differently in a more transparent way. We never changed the existing code. The most important part is currently the cTable which is used intensively in the compiler.

Definition at line 2551 of file structs.h.

3.41.2 Field Documentation

3.41.2.1 Operation

```

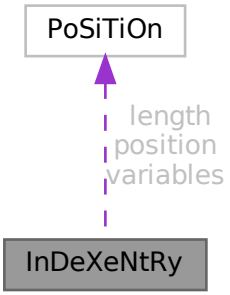
3.52 InDeXeNtRy Struct Reference

```
#include <structs.h>
```

Collaboration diagram for InDeXeNtRy:



Data Fields

- POSITION position
- POSITION length
- POSITION variables
- LONG CompressSize
- WORD nsymbols
- WORD nindices
- WORD nvectors
- WORD nfunctions
- WORD size
- SBYTE name [MAXENAME+1]

3.52.1 Detailed Description

Defines the structure of an entry in a file index (see struct FiLeInDeX).

It represents one expression in the file.

Definition at line 100 of file structs.h.

3.52.2 Field Documentation

3.52.2.1 position

`POSITION InDeXeNtRy::position`

Position of the expression itself

Definition at line 101 of file structs.h.

3.52.2.2 length

`POSITION InDeXeNtRy::length`

Length of the expression itself

Definition at line 102 of file structs.h.

3.52.2.3 variables

`POSITION InDeXeNtRy::variables`

Position of the list with variables

Definition at line 103 of file structs.h.

3.52.2.4 CompressSize

`LONG InDeXeNtRy::CompressSize`

Size of buffer before compress

Definition at line 104 of file structs.h.

3.52.2.5 nsymbols

`WORD InDeXeNtRy::nsymbols`

Number of symbols in the list

Definition at line 105 of file structs.h.

Referenced by ReadSaveVariables().

3.52.2.6 nindices

```
WORD InDeXeNtRy::nindices
```

Number of indices in the list

Definition at line 106 of file structs.h.

Referenced by ReadSaveVariables().

3.52.2.7 nvectors

```
WORD InDeXeNtRy::nvectors
```

Number of vectors in the list

Definition at line 107 of file structs.h.

Referenced by ReadSaveVariables().

3.52.2.8 nfunctions

```
WORD InDeXeNtRy::nfunctions
```

Number of functions in the list

Definition at line 108 of file structs.h.

Referenced by ReadSaveVariables().

3.52.2.9 size

```
WORD InDeXeNtRy::size
```

Size of variables field

Definition at line 109 of file structs.h.

3.52.2.10 name

```
SBYTE InDeXeNtRy::name[MAXENAME+1]
```

Name of expression

Definition at line 110 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.53 iniinfo Struct Reference

Data Fields

- MLONG entriesinindex
- MLONG numberofindexblocks
- MLONG firstindexblock
- MLONG lastindexblock
- MLONG numberoftables
- MLONG numberofnamesblocks
- MLONG firstnameblock
- MLONG lastnameblock

3.53.1 Detailed Description

Definition at line 85 of file minos.h.

3.53.2 Field Documentation

3.53.2.1 entriesinindex

```
MLONG iniinfo::entriesinindex
```

Definition at line 87 of file minos.h.

3.53.2.2 numberofindexblocks

```
MLONG iniinfo::numberofindexblocks
```

Definition at line 273 of file grcc.h.

3.55.4.13 nslist

```
int Interaction::nslist
```

Definition at line 274 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.56 KEYWORD Struct Reference

`#include <structs.h>`

Data Fields

- char * name
- TFUN func
- int type
- int flags

3.56.1 Detailed Description

The KEYWORD struct defines names of commands/statements and the routine to be called when they are encountered by the compiler or preprocessor.

Definition at line 218 of file structs.h.

3.56.2 Field Documentation

3.56.2.1 name

`char* KEYWORD::name`

Definition at line 219 of file structs.h.

3.56.2.2 func

`TFUN KEYWORD::func`

Definition at line 220 of file structs.h.

3.56.2.3 type

`int KEYWORD::type`

Definition at line 221 of file structs.h.

3.56.2.4 flags

`int KEYWORD::flags`

Definition at line 222 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.57 KEYWORDV Struct Reference

`#include <structs.h>`

Data Fields

- char * name
- int * var
- int type
- int flags

3.57.1 Detailed Description

The KEYWORDV struct defines names of commands/statements and the variable to be affected when they are encountered by the compiler or preprocessor.

Definition at line 230 of file structs.h.

3.57.2 Field Documentation

3.57.2.1 name

`char* KEYWORDV::name`

Definition at line 231 of file structs.h.

3.57.2.2 var

`int* KEYWORDV::var`

Definition at line 232 of file structs.h.

3.57.2.3 type

`int KEYWORDV::type`

Definition at line 233 of file structs.h.

3.57.2.4 flags

`int KEYWORDV::flags`

Definition at line 234 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.58 LIST Struct Reference

```
#include <structs.h>
```

Data Fields

- void * lijst
- char * message
- int num
- int maxnum
- int size
- int numglobal
- int numtemp
- int numclear

3.58.1 Detailed Description

Much information is stored in arrays of which we can double the size if the array proves to be too small. Such arrays are controlled by a variable of type LIST. The routines that expand the lists are in the file tools.c

Definition at line 202 of file structs.h.

3.58.2 Field Documentation

3.58.2.1 lijst

```
void* LIST::lijst
```

[D] Holds space for "maxnum" elements of size "size" each

Definition at line 203 of file structs.h.

3.58.2.2 message

```
char* LIST::message
```

Text for Malloc1 when allocating lijst. Set to constant string.

Definition at line 204 of file structs.h.

3.58.2.3 num

```
int LIST::num
```

Number of elements in lijst.

Definition at line 205 of file structs.h.

3.58.2.4 maxnum

```
int LIST::maxnum
```

Maximum number of elements in lijst.

Definition at line 206 of file structs.h.

3.58.2.5 size

```
int LIST::size
```

Size of one element in lijst.

Definition at line 207 of file structs.h.

3.58.2.6 numglobal

```
int LIST::numglobal
```

Marker for position when .global is executed.

Definition at line 208 of file structs.h.

3.58.2.7 numtemp

```
int LIST::numtemp
```

At the moment only needed for sets and setstore.

Definition at line 209 of file structs.h.

3.58.2.8 numclear

```
int LIST::numclear
```

Only for the clear instruction.

Definition at line 210 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.59 longMultiStruct Struct Reference

Collaboration diagram for longMultiStruct:

Data Fields

- UBYTE * buffer
- int bufpos
- int packpos
- int nPacks
- int lastLen
- struct longMultiStruct * next

3.59.1 Detailed Description

Definition at line 1124 of file mpi.c.

3.59.2 Field Documentation

3.59.2.1 buffer

```
UBYTE* longMultiStruct::buffer
```

Definition at line 1125 of file mpi.c.

3.59.2.2 bufpos

```
int longMultiStruct::bufpos
```

Definition at line 1126 of file mpi.c.

3.59.2.3 packpos

```
int longMultiStruct::packpos
```

Definition at line 1127 of file mpi.c.

3.59.2.4 nPacks

```
int longMultiStruct::nPacks
```

Definition at line 1128 of file mpi.c.

3.60.1 Detailed Description

The M_const struct is part of the global data and resides in the ALLGLOBALS struct A under the name #M. We see it used with the macro AM as in AM.S0. It contains global settings at startup or .clear.

Definition at line 1419 of file structs.h.

3.60.2 Field Documentation

3.60.2.1 zeropos

```
POSITION M_const::zeropos
```

Definition at line 1420 of file structs.h.

3.60.2.2 S0

```
SORTING* M_const::S0
```

[D] The main sort buffer

Definition at line 1421 of file structs.h.

3.60.2.3 gcmod

```
UWORD* M_const::gcmod
```

Global setting of modulus. Uses AC.cmod's memory

Definition at line 1422 of file structs.h.

3.60.2.4 gpowmod

```
UWORD* M_const::gpowmod
```

Global setting printing as powers. Uses AC.cmod's memory

Definition at line 1423 of file structs.h.

3.60.2.5 TempDir

```
UBYTE* M_const::TempDir
```

Definition at line 1424 of file structs.h.

3.60.2.6 TempSortDir

```
UBYTE* M_const::TempSortDir
```

Definition at line 1425 of file structs.h.

3.60.2.7 IncDir

```
UBYTE* M_const::IncDir
```

Definition at line 1426 of file structs.h.

3.60.2.8 InputFileName

```
UBYTE* M_const::InputFileName
```

Definition at line 1427 of file structs.h.

3.60.2.9 LogFileName

```

Definition at line 1595 of file structs.h.

3.60.2.164 FromStdin

```
BOOL M_const::FromStdin
```

Definition at line 1596 of file structs.h.

3.60.2.165 IgnoreDeprecation

```
BOOL M_const::IgnoreDeprecation
```

Definition at line 1597 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.61 MCBlock Class Reference

Public Member Functions

- void init (void)

Data Fields

- Edge2n * edges
- int nmedges
- int nartps
- int loop
- int DUMMYPADDING

3.61.1 Detailed Description

Definition at line 985 of file grcc.h.

3.61.2 Constructor & Destructor Documentation

3.61.2.1 MCBlock()

```
MCBlock::MCBlock (
            void  )
```

Definition at line 5512 of file grcc.cc.

3.61.2.2 ~MCBlock()

```
MCBlock::~MCBlock (
            void  )
```

Definition at line 5518 of file grcc.cc.

3.61.3 Member Function Documentation

3.61.3.1 init()

```
void MCBlock::init (
            void  )
```

Definition at line 5523 of file grcc.cc.

3.61.4 Field Documentation

3.61.4.1 edges

```
Edge2n* MCBlock::edges
```

Definition at line 987 of file grcc.h.

3.61.4.2 nmedges

```
int MCBlock::nmedges
```

Definition at line 988 of file grcc.h.

3.61.4.3 nartps

```
int MCBlock::nartps
```

Definition at line 989 of file grcc.h.

3.61.4.4 loop

```
int MCBlock::loop
```

Definition at line 990 of file grcc.h.

3.61.4.5 DUMMYPADDING

```
int MCBlock::DUMMYPADDING
```

Definition at line 992 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.62 MCBridge Class Reference

Data Fields

- Edge2n nodes
- int next

3.62.1 Detailed Description

Definition at line 973 of file grcc.h.

3.62.2 Constructor & Destructor Documentation

3.62.2.1 MCBridge()

```
MCBridge::MCBridge (
            void  )
```

Definition at line 5500 of file grcc.cc.

3.62.2.2 ~MCBridge()

```
MCBridge::~MCBridge (
            void  )
```

Definition at line 5505 of file grcc.cc.

3.62.3 Field Documentation

3.62.3.1 nodes

```
Edge2n MCBridge::nodes
```

Definition at line 975 of file grcc.h.

3.62.3.2 next

```
int MCBridge::next
```

Definition at line 976 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.63 MCEdge Class Reference

Data Fields

- Edge2n nodes
- ULong momset
- int momdir
- int DUMMYPADDING

3.63.1 Detailed Description

Definition at line 936 of file grcc.h.

3.63.2 Constructor & Destructor Documentation

3.63.2.1 MCEdge()

```
MCEdge::MCEdge (
            void  )
```

Definition at line 5459 of file grcc.cc.

3.63.2.2 ~MCEdge()

```
MCEdge::~MCEdge (
            void  )
```

Definition at line 5465 of file grcc.cc.

3.66.1 Detailed Description

Definition at line 793 of file grcc.h.

3.66.2 Constructor & Destructor Documentation

3.66.2.1 MGraph() [1/2]

```
MGraph::MGraph (
            int pid,
            int ncl,
            NCInput * mgi,
            Options * opt )
```

Definition at line 4074 of file grcc.cc.

3.66.2.2 MGraph() [2/2]

```
MGraph::MGraph (
            int pid,
            int ncl,
            int * cldeg,
            int * clnum,
            int * clexl,
            int * cmind,
            int * cmaxd,
            Options * opt )
```

Definition at line 4006 of file grcc.cc.

3.66.2.3 ~MGraph()

```
MGraph::~MGraph (
            void  )
```

Definition at line 4190 of file grcc.cc.

3.66.3 Member Function Documentation

3.66.3.1 init()

```
void MGraph::init (
            void  )
```

Definition at line 4146 of file grcc.cc.

3.66.3.2 generate()

```
BigInt MGraph::generate (
            void  )
```

Definition at line 4961 of file grcc.cc.

3.66.3.3 isExternal()

```
Bool MGraph::isExternal (
            int nd )  [inline]
```

Definition at line 876 of file grcc.h.

3.66.3.4 printAdjMat()

```
void MGraph::printAdjMat (
            MNodeClass * cl )
```

Definition at line 4220 of file grcc.cc.

3.66.3.5 print()

```
void MGraph::print (
            void  )
```

Definition at line 4239 of file grcc.cc.

3.66.3.6 printPy()

```
void MGraph::printPy (
            FILE * fp,
            long mId )
```

Definition at line 4263 of file grcc.cc.

3.66.3.7 isConnected()

```
Bool MGraph::isConnected (
            void  )
```

Definition at line 4294 of file grcc.cc.

3.66.3.8 visit()

```
Bool MGraph::visit (
            int nd )
```

Definition at line 4318 of file grcc.cc.

3.66.3.9 isIsomorphic()

```
Bool MGraph::isIsomorphic (
            MNodeClass * cl )
```

Definition at line 4343 of file grcc.cc.

3.66.3.10 permMat()

```
void MGraph::permMat (
            int size,
            int * perm,
            int ** mat0,
            int ** mat1 )
```

Definition at line 4401 of file grcc.cc.

3.66.3.11 compMat()

```
int MGraph::compMat (
            int size,
            int ** mat0,
            int ** mat1 )
```

Definition at line 4415 of file grcc.cc.

3.66.3.12 refineClass()

```
MNodeClass * MGraph::refineClass (
            MNodeClass * cl )
```

Definition at line 4433 of file grcc.cc.

3.66.3.13 bisearchME()

```
void MGraph::bisearchME (
            int nd,
            int pd,
            int ned,
            int col,
            MCOpi * mopi,
            MCBlock * mblk,
            ULong * momset,
            int * next,
            int * nart )
```

Definition at line 4640 of file grcc.cc.

3.66.3.14 biconnME()

```
void MGraph::biconnME (
            void  )
```

Definition at line 4515 of file grcc.cc.

3.66.3.15 isOptM()

```
Bool MGraph::isOptM (
            void  )
```

Definition at line 5172 of file grcc.cc.

3.66.3.16 connectClass()

```
void MGraph::connectClass (
            MNodeClass * cl )
```

Definition at line 4980 of file grcc.cc.

3.66.3.17 connectNode()

```
void MGraph::connectNode (
            int sc,
            int ss,
            MNodeClass * cl )
```

Definition at line 5008 of file grcc.cc.

3.66.3.18 connectLeg()

```
void MGraph::connectLeg (
            int sc,
            int sn,
            int tc,
            int ts,
            MNodeClass * cl )
```

Definition at line 5025 of file grcc.cc.

3.66.3.19 newGraph()

```
void MGraph::newGraph (
            MNodeClass * cl )
```

Definition at line 5238 of file grcc.cc.

- int defpart
- int ncouple
- const char * cnamlist [GRCC_MAXNCPLG]

3.68.1 Detailed Description

Definition at line 175 of file grccparam.h.

3.68.2 Field Documentation

3.68.2.1 name

```
const char* MInput::name
```

Definition at line 176 of file grccparam.h.

3.68.2.2 defpart

```
int MInput::defpart
```

Definition at line 177 of file grccparam.h.

3.68.2.3 ncouple

```
int MInput::ncouple
```

Definition at line 179 of file grccparam.h.

3.68.2.4 cnamlist

```
const char* MInput::cnamlist[GRCC_MAXNCPLG]
```

Definition at line 180 of file grccparam.h.

The documentation for this struct was generated from the following file:

- grccparam.h

3.69 MNode Class Reference

Public Member Functions

- MNode (int id, int clss, NCInput *mgi)
- MNode (int id, int deg, int extloop, int clss, int cmind, int cmaxd)

Data Fields

- int id
- int deg
- int clss
- int extloop
- int cmindeg
- int cmaxdeg
- int freelg
- int visited

3.69.1 Detailed Description

Definition at line 771 of file grcc.h.

3.69.2 Constructor & Destructor Documentation

3.69.2.1 MNode() [1/2]

```
MNode::MNode (
            int id,
            int clss,
            NCInput * mgi )
```

Definition at line 3968 of file grcc.cc.

3.69.2.2 MNode() [2/2]

```
MNode::MNode (
            int id,
            int deg,
            int extloop,
            int clss,
            int cmind,
            int cmaxd )
```

Definition at line 3986 of file grcc.cc.

3.69.3 Field Documentation

3.69.3.1 id

```
int MNode::id
```

Definition at line 773 of file grcc.h.

3.69.3.2 deg

```
int MNode::deg
```

Definition at line 774 of file grcc.h.

3.69.3.3 clss

```
int MNode::clss
```

Definition at line 775 of file grcc.h.

3.69.3.4 extloop

```
int MNode::extloop
```

Definition at line 776 of file grcc.h.

3.69.3.5 cmindeg

```
int MNode::cmindeg
```

Definition at line 777 of file grcc.h.

3.69.3.6 cmaxdeg

```
int MNode::cmaxdeg
```

Definition at line 778 of file grcc.h.

3.69.3.7 freelg

```
int MNode::freelg
```

Definition at line 780 of file grcc.h.

3.69.3.8 visited

```
int MNode::visited
```

Definition at line 781 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.70 MNodeClass Class Reference

Public Member Functions

- MNodeClass (int nnodes, int nclasses)
- void init (int *cl, int mxdeg, int **adjmat)
- void copy (MNodeClass *mnc)
- int clCmp (int nd0, int nd1, int cn)
- void printMat (void)
- void mkFlist (void)
- void mkNdCl (void)
- void mkClMat (int **adjmat)
- void incMat (int nd, int td, int val)
- int cmpMNCArray (int *a0, int *a1, int ma)
- void reorder (MGraph *mg)

Data Fields

- int clmat [GRCC_MAXNODES][GRCC_MAXNODES]
- int clist [GRCC_MAXNODES]
- int ndcl [GRCC_MAXNODES]
- int flist [GRCC_MAXNODES+1]
- int clord [GRCC_MAXNODES]
- int cmindeg [GRCC_MAXNODES]
- int cmaxdeg [GRCC_MAXNODES]
- int nNodes
- int nClasses
- int maxdeg
- int flg0
- int flg1
- int flg2

3.70.1 Detailed Description

Definition at line 900 of file grcc.h.

3.70.2 Constructor & Destructor Documentation

3.70.2.1 MNodeClass()

```
MNodeClass::MNodeClass (
            int nnodes,
            int nclasses )
```

Definition at line 3721 of file grcc.cc.

3.70.2.2 ~MNodeClass()

```
MNodeClass::~MNodeClass (
            void  )
```

Definition at line 3750 of file grcc.cc.

3.70.3 Member Function Documentation

3.70.3.1 init()

```
void MNodeClass::init (
            int * cl,
            int mxdeg,
            int ** adjmat )
```

Definition at line 3757 of file grcc.cc.

3.70.3.2 copy()

```
void MNodeClass::copy (
            MNodeClass * mnc )
```

Definition at line 3781 of file grcc.cc.

3.70.3.3 clCmp()

```
int MNodeClass::clCmp (
            int nd0,
            int nd1,
            int cn )
```

Definition at line 3837 of file grcc.cc.

3.70.3.4 printMat()

```
void MNodeClass::printMat (
            void  )
```

Definition at line 3888 of file grcc.cc.

3.70.3.5 mkFlist()

```
void MNodeClass::mkFlist (
            void  )
```

Definition at line 3805 of file grcc.cc.

3.70.3.6 mkNdCl()

```
void MNodeClass::mkNdCl (
            void  )
```

Definition at line 3821 of file grcc.cc.

3.70.3.7 mkClMat()

```
void MNodeClass::mkClMat (
            int ** adjmat )
```

Definition at line 3859 of file grcc.cc.

3.70.3.8 incMat()

```
void MNodeClass::incMat (
            int nd,
            int td,
            int val )
```

Definition at line 3879 of file grcc.cc.

3.70.3.9 cmpMNCArray()

```
int MNodeClass::cmpMNCArray (
            int * a0,
            int * a1,
            int ma )
```

Definition at line 3919 of file grcc.cc.

3.70.3.10 reorder()

```
void MNodeClass::reorder (
            MGraph * mg )
```

Definition at line 3935 of file grcc.cc.

3.70.4 Field Documentation

3.70.4.1 clmat

```
int MNodeClass::clmat[GRCC_MAXNODES][GRCC_MAXNODES]
```

Definition at line 902 of file grcc.h.

3.70.4.2 clist

```
int MNodeClass::clist[GRCC_MAXNODES]
```

Definition at line 903 of file grcc.h.

3.70.4.3 ndcl

```
int MNodeClass::ndcl[GRCC_MAXNODES]
```

Definition at line 904 of file grcc.h.

3.70.4.4 flist

```
int MNodeClass::flist[GRCC_MAXNODES+1]
```

Definition at line 905 of file grcc.h.

3.70.4.5 clord

```
int MNodeClass::clord[GRCC_MAXNODES]
```

Definition at line 906 of file grcc.h.

3.70.4.6 cmindeg

```
int MNodeClass::cmindeg[GRCC_MAXNODES]
```

Definition at line 907 of file grcc.h.

3.70.4.7 cmaxdeg

```
int MNodeClass::cmaxdeg[GRCC_MAXNODES]
```

Definition at line 908 of file grcc.h.

3.70.4.8 nNodes

```
int MNodeClass::nNodes
```

Definition at line 909 of file grcc.h.

3.70.4.9 nClasses

```
int MNodeClass::nClasses
```

Definition at line 910 of file grcc.h.

3.70.4.10 maxdeg

```
int MNodeClass::maxdeg
```

Definition at line 911 of file grcc.h.

3.70.4.11 flg0

```
int MNodeClass::flg0
```

Definition at line 913 of file grcc.h.

3.70.4.12 flg1

```
int MNodeClass::flg1
```

Definition at line 914 of file grcc.h.

3.70.4.13 flg2

```
int MNodeClass::flg2
```

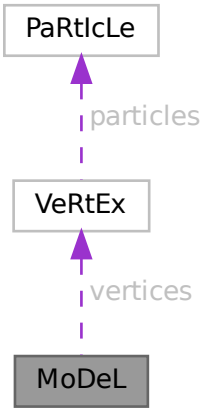
Definition at line 915 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.71 MoDeL Struct Reference

Collaboration diagram for MoDeL:



Data Fields

- VERTEX ** vertices
- WORD * couplings
- UBYTE * name
- void * grccmodel
- WORD legcouple [MAXLEGS+2]
- WORD nparticles
- WORD nvertices
- WORD invertices
- WORD sizevertices
- WORD sizecouplings
- WORD ncouplings
- WORD error
- WORD dummy

3.71.1 Detailed Description

Definition at line 636 of file structs.h.

3.71.2 Field Documentation

3.71.2.1 vertices

```
VERTEX** MoDeL::vertices
```

Definition at line 637 of file structs.h.

3.71.2.2 couplings

```
WORD* MoDeL::couplings
```

Definition at line 638 of file structs.h.

3.71.2.3 name

```
UBYTE* MoDeL::name
```

Definition at line 639 of file structs.h.

3.71.2.4 grccmodel

```
void* MoDeL::grccmodel
```

Definition at line 640 of file structs.h.

3.71.2.5 legcouple

```
WORD MoDeL::legcouple[MAXLEGS+2]
```

Definition at line 641 of file structs.h.

3.71.2.6 nparticles

```
WORD MoDeL::nparticles
```

Definition at line 642 of file structs.h.

3.71.2.7 nvertices

```
WORD MoDeL::nvertices
```

Definition at line 643 of file structs.h.

3.71.2.8 invertices

```
WORD MoDeL::invertices
```

Definition at line 644 of file structs.h.

3.71.2.9 sizevertices

```
WORD MoDeL::sizevertices
```

Definition at line 645 of file structs.h.

3.71.2.10 sizecouplings

```
WORD MoDeL::sizecouplings
```

Definition at line 646 of file structs.h.

3.71.2.11 ncouplings

```
WORD MoDeL::ncouplings
```

Definition at line 647 of file structs.h.

3.71.2.12 error

```
WORD MoDeL::error
```

Definition at line 648 of file structs.h.

3.71.2.13 dummy

```
WORD MoDeL::dummy
```

Definition at line 649 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.72.1 Detailed Description

Definition at line 284 of file grcc.h.

3.72.2 Constructor & Destructor Documentation

3.72.2.1 Model()

```
Model::Model (
            MInput * minp )
```

Definition at line 1979 of file grcc.cc.

3.72.2.2 ~Model()

```
Model::~Model (
            void  )
```

Definition at line 2040 of file grcc.cc.

3.72.3 Member Function Documentation

3.72.3.1 prModel()

```
void Model::prModel (
            void  )
```

Definition at line 2082 of file grcc.cc.

3.72.3.2 addParticle()

```
void Model::addParticle (
            PInput * pinp )
```

Definition at line 2131 of file grcc.cc.

3.72.3.3 addParticleEnd()

```
void Model::addParticleEnd (
            void  )
```

Definition at line 2173 of file grcc.cc.

3.72.3.4 addInteraction()

```
void Model::addInteraction (
            IInput * iinp )
```

Definition at line 2211 of file grcc.cc.

3.72.3.5 addInteractionEnd()

```
void Model::addInteractionEnd (
            void  )
```

Definition at line 2340 of file grcc.cc.

3.72.3.6 findParticleName()

```
int Model::findParticleName (
            const char * name )
```

Definition at line 2410 of file grcc.cc.

3.72.3.7 findParticleCode()

```
int Model::findParticleCode (
            int pcd )
```

Definition at line 2428 of file grcc.cc.

3.72.3.8 findInteractionName()

```
int Model::findInteractionName (
            const char * name )
```

Definition at line 2547 of file grcc.cc.

3.72.3.9 findInteractionCode()

```
int Model::findInteractionCode (
            int icd )
```

Definition at line 2560 of file grcc.cc.

3.72.3.10 particleName()

```
char * Model::particleName (
            int p )
```

Definition at line 2443 of file grcc.cc.

3.72.3.11 particleCode()

```
int Model::particleCode (
            int p )
```

Definition at line 2463 of file grcc.cc.

3.72.3.12 normalParticle()

```
int Model::normalParticle (
            int pt )
```

Definition at line 2509 of file grcc.cc.

3.72.3.13 antiParticle()

```
int Model::antiParticle (
            int pt )
```

Definition at line 2526 of file grcc.cc.

3.72.3.14 allParticles()

```
int * Model::allParticles (
            int * len )
```

Definition at line 2540 of file grcc.cc.

3.72.3.15 findMClass()

```
int Model::findMClass (
            const int cpl,
            const int dgr )
```

Definition at line 2496 of file grcc.cc.

3.72.3.16 prParticleArray()

```
void Model::prParticleArray (
            int n,
            int * a,
            const char * msg )
```

Definition at line 2481 of file grcc.cc.

3.72.3.17 printMInput()

```
void Model::printMInput (
            MInput * min )  [static]
```

Definition at line 2573 of file grcc.cc.

3.72.3.18 printPInput()

```
void Model::printPInput (
            PInput * pin )  [static]
```

Definition at line 2593 of file grcc.cc.

3.72.3.19 printIInput()

```
void Model::printIInput (
            IInput * iin )  [static]
```

Definition at line 2601 of file grcc.cc.

3.77 flint::mpoly Class Reference

Public Member Functions

- mpoly (fmpz_mpoly_ctx_struct *ctx_in)
- void print (const string &text)

Data Fields

- fmpz_mpoly_t d

3.77.1 Detailed Description

Definition at line 103 of file flintinterface.h.

3.77.2 Constructor & Destructor Documentation

3.77.2.1 mpoly()

```
flint::mpoly::mpoly (
            fmpz_mpoly_ctx_struct * ctx_in )  [inline], [explicit]
```

Definition at line 108 of file flintinterface.h.

3.77.2.2 ~mpoly()

```
flint::mpoly::~mpoly ( )  [inline]
```

Definition at line 109 of file flintinterface.h.

3.77.3 Member Function Documentation

3.77.3.1 print()

```
void flint::mpoly::print (
            const string & text )  [inline]
```

Definition at line 110 of file flintinterface.h.

3.77.4 Field Documentation

3.77.4.1 d

```
fmpz_mpoly_t flint::mpoly::d
```

Definition at line 107 of file flintinterface.h.

The documentation for this class was generated from the following file:

- flintinterface.h

3.78 flint::mpoly_ctx Class Reference

Public Member Functions

- mpoly_ctx (int64_t nvars)

Data Fields

- fmpz_mpoly_ctx_t d

3.78.1 Detailed Description

Definition at line 126 of file flintinterface.h.

3.78.2 Constructor & Destructor Documentation

3.78.2.1 mpoly_ctx()

```
flint::mpoly_ctx::mpoly_ctx (
            int64_t nvars )  [inline], [explicit]
```

Definition at line 129 of file flintinterface.h.

3.78.2.2 ~mpoly_ctx()

```
flint::mpoly_ctx::~mpoly_ctx ( )  [inline]
```

Definition at line 130 of file flintinterface.h.

3.78.3 Field Documentation

3.78.3.1 d

```
fmpz_mpoly_ctx_t flint::mpoly_ctx::d
```

Definition at line 128 of file flintinterface.h.

The documentation for this class was generated from the following file:

- flintinterface.h

3.79 flint::mpoly_factor Class Reference

Public Member Functions

- mpoly_factor (fmpz_mpoly_ctx_struct *ctx_in)

Data Fields

- fmpz_mpoly_factor_t d

3.79.1 Detailed Description

Definition at line 116 of file flintinterface.h.

3.79.2 Constructor & Destructor Documentation

3.79.2.1 mpoly_factor()

```
flint::mpoly_factor::mpoly_factor (
            fmpz_mpoly_ctx_struct * ctx_in )  [inline], [explicit]
```

Definition at line 121 of file flintinterface.h.

3.79.2.2 ~mpoly_factor()

```
flint::mpoly_factor::~mpoly_factor ( )  [inline]
```

Definition at line 124 of file flintinterface.h.

3.79.3 Field Documentation

3.79.3.1 d

```
fmpz_mpoly_factor_t flint::mpoly_factor::d
```

Definition at line 120 of file flintinterface.h.

The documentation for this class was generated from the following file:

3.80.1 Detailed Description

The N_const struct is part of the global data and resides either in the ALLGLOBALS struct A, or the ALLPRIVATES struct B (TFORM) under the name N We see it used with the macro AN as in AN.RepFunNum It has variables that are private to each thread and are used as temporary storage during the expansion of the terms tree.

The documentation for this struct was generated from the following file:

- structs.h

3.81 nameblock Struct Reference

Data Fields

- MLONG previousblock
- MLONG position
- char names [NAMETABLESIZE]

3.81.1 Detailed Description

Definition at line 117 of file minos.h.

3.81.2 Field Documentation

3.81.2.1 previousblock

```
MLONG nameblock::previousblock
```

Definition at line 118 of file minos.h.

3.81.2.2 position

```
MLONG nameblock::position
```

Definition at line 119 of file minos.h.

3.81.2.3 names

```
char nameblock::names[NAMETABLESIZE]
```

Definition at line 120 of file minos.h.

The documentation for this struct was generated from the following file:

- minos.h

3.82 NaMeNode Struct Reference

```
#include <structs.h>
```

Data Fields

- LONG name
- WORD parent
- WORD left
- WORD right
- WORD balance
- WORD type
- WORD number

3.82.1 Detailed Description

The names of variables are kept in an array. Elements of type NAMENODE define a tree (that is kept balanced) that make it easy and fast to look for variables. See also NAMETREE.

Definition at line 243 of file structs.h.

3.82.2 Field Documentation

3.82.2.1 name

```
LONG NaMeNode::name
```

Offset into NAMETREE::namebuffer.

Definition at line 244 of file structs.h.

3.82.2.2 parent

```
WORD NaMeNode::parent
```

=-1 if no parent.

Definition at line 245 of file structs.h.

3.82.2.3 left

```
WORD NaMeNode::left
```

=-1 if no child.

Definition at line 246 of file structs.h.

3.82.2.4 right

```
WORD NaMeNode::right
```

=-1 if no child.

Definition at line 247 of file structs.h.

3.82.2.5 balance

```
WORD NaMeNode::balance
```

Used for the balancing of the tree.

Definition at line 248 of file structs.h.

3.82.2.6 type

```
WORD NaMeNode::type
```

Type associated with the name. See compiler types.

Definition at line 249 of file structs.h.

3.82.2.7 number

```
WORD NaMeNode::number
```

Number of variable in LIST's like for example C_const::SymbolList.

Definition at line 250 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

UBYTE* NaMeSpAcE::name
```

Definition at line 661 of file structs.h.

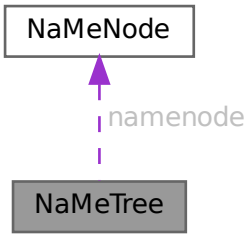
The documentation for this struct was generated from the following file:

- structs.h

3.84 NaMeTree Struct Reference

```
#include <structs.h>
```

Collaboration diagram for NaMeTree:



Data Fields

- NAMENODE * namenode
- UBYTE * namebuffer
- LONG nodesize
- LONG nodefill
- LONG namesize
- LONG namefill
- LONG oldnamefill
- LONG oldnodefill
- LONG globalnamefill
- LONG globalnodefill
- LONG clearnamefill
- LONG clearnodefill
- WORD headnode

3.84.1 Detailed Description

A struct of type NAMETREE controls a complete (balanced) tree of names for the compiler. The compiler maintains several of such trees and the system has been set up in such a way that one could define more of them if we ever want to work with local name spaces.

Definition at line 260 of file structs.h.

3.84.2 Field Documentation

3.84.2.1 namenode

```
NAMENODE* NaMeTree::namenode
```

[D] Vector of NAMENODE's. Number of elements is nodesize. =0 if no memory has been allocated.

Definition at line 261 of file structs.h.

3.84.2.2 namebuffer

```
UBYTE* NaMeTree::namebuffer
```

[D] Buffer that holds all the name strings referred to by the NAMENODE's. Allocation size is namesize. =0 if no memory has been allocated.

Definition at line 263 of file structs.h.

3.84.2.3 nodesize

```
LONG NaMeTree::nodesize
```

Maximum number of elements in namenode.

Definition at line 266 of file structs.h.

3.84.2.4 nodefill

```
LONG NaMeTree::nodefill
```

Number of currently used nodes in namenode.

Definition at line 267 of file structs.h.

3.84.2.5 namesize

```
LONG NaMeTree::namesize
```

Allocation size of namebuffer in bytes.

Definition at line 268 of file structs.h.

3.84.2.6 namefill

```
LONG NaMeTree::namefill
```

Number of bytes occupied.

Definition at line 269 of file structs.h.

3.84.2.7 oldnamefill

```
LONG NaMeTree::oldnamefill
```

UNUSED

Definition at line 270 of file structs.h.

3.84.2.8 oldnodefill

```
LONG NaMeTree::oldnodefill
```

UNUSED

Definition at line 271 of file structs.h.

3.84.2.9 globalnamefill

```
LONG NaMeTree::globalnamefill
```

Set by .global statement to the value of namefill. When a .store command is processed, this value will be used to reset namefill.

Definition at line 272 of file structs.h.

3.84.2.10 globalnodefill

```
LONG NaMeTree::globalnodefill
```

Same usage as globalnamefill, but for nodefill.

Definition at line 274 of file structs.h.

3.84.2.11 clearnamefill

```
LONG NaMeTree::clearnamefill
```

Marks the reset point used by the .clear statement.

Definition at line 275 of file structs.h.

3.84.2.12 clearnodefill

```
LONG NaMeTree::clearnodefill
```

Marks the reset point used by the .clear statement.

Definition at line 276 of file structs.h.

3.84.2.13 headnode

```
WORD NaMeTree::headnode
```

Offset in namenode of head node. =-1 if tree is empty.

Definition at line 277 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.85 NCand Class Reference

Public Member Functions

- NCand (const NCandSt sta, const int dega, const int nilst, int ∗ilst)
- void prNCand (const char ∗msg)

Data Fields

- int deg
- NCandSt st
- int nilist
- int ilist [GRCC_MAXMINTERACT]

3.85.1 Detailed Description

Definition at line 1106 of file grcc.h.

3.85.2 Constructor & Destructor Documentation

3.85.2.1 NCand()

```
NCand::NCand (
            const NCandSt sta,
            const int dega,
            const int nilst,
            int * ilst )
```

Definition at line 8147 of file grcc.cc.

3.85.2.2 ~NCand()

```
NCand::~NCand (
            void  )
```

Definition at line 8174 of file grcc.cc.

3.85.3 Member Function Documentation

3.85.3.1 prNCand()

```
void NCand::prNCand (
            const char * msg )
```

Definition at line 8179 of file grcc.cc.

3.85.4 Field Documentation

3.85.4.1 deg

```
int NCand::deg
```

Definition at line 1110 of file grcc.h.

3.85.4.2 st

```
NCandSt NCand::st
```

Definition at line 1111 of file grcc.h.

3.85.4.3 nilist

```
int NCand::nilist
```

Definition at line 1112 of file grcc.h.

3.85.4.4 ilist

```
int NCand::ilist[GRCC_MAXMINTERACT]
```

Definition at line 1113 of file grcc.h.

The documentation for this class was generated from the following files:

- grcc.h
- grcc.cc

3.86 NCInput Struct Reference

Data Fields

- int cldeg
- int clnum
- int cltyp
- int cmind
- int cmaxd
- int ptcl
- int cple

3.86.1 Detailed Description

Definition at line 205 of file grccparam.h.

3.86.2 Field Documentation

3.86.2.1 cldeg

```
int NCInput::cldeg
```

Definition at line 207 of file grccparam.h.

3.86.2.2 clnum

```
int NCInput::clnum
```

Definition at line 208 of file grccparam.h.

3.86.2.3 cltyp

```
int NCInput::cltyp
```

Definition at line 209 of file grccparam.h.

3.86.2.4 cmind

```
int NCInput::cmind
```

Definition at line 210 of file grccparam.h.

3.86.2.5 cmaxd

```
int NCInput::cmaxd
```

Definition at line 211 of file grccparam.h.

3.86.2.6 ptcl

```
int NCInput::ptcl
```

Definition at line 214 of file grccparam.h.

3.86.2.7 cple

```
int NCInput::cple
```

Definition at line 215 of file grccparam.h.

The documentation for this struct was generated from the following file:

- grccparam.h

3.87 NeStInG Struct Reference

```
#include <structs.h>
```

Data Fields

- WORD * termsize
- WORD * funsize
- WORD * argsize

3.87.1 Detailed Description

The NESTING struct is used when we enter the argument of functions and there is the possibility that we have to change something there. Because functions can be nested we have to keep track of all levels of functions in case we have to move the outer layers to make room for a larger function argument.

Definition at line 1032 of file structs.h.

3.87.2 Field Documentation

3.87.2.1 termsize

```
WORD* NeStInG::termsize
```

Definition at line 1033 of file structs.h.

3.87.2.2 funsize

```
WORD* NeStInG::funsize
```

Definition at line 1034 of file structs.h.

3.87.2.3 argsize

```
WORD* NeStInG::argsize
```

Definition at line 1035 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.88 NoDe Struct Reference

Collaboration diagram for NoDe:

Data Fields

- struct NoDe * left
- struct NoDe * rght
- int lloser
- int rloser
- int lsrc
- int rsrc

3.88.1 Detailed Description

A node for the tree of losers in the final sorting on the master.

Definition at line 272 of file parallel.c.

3.88.2 Field Documentation

3.88.2.1 left

```
struct NoDe* NoDe::left
```

Definition at line 273 of file parallel.c.

3.88.2.2 rght

```
struct NoDe* NoDe::rght
```

Definition at line 274 of file parallel.c.

3.88.2.3 lloser

```
int NoDe::lloser
```

Definition at line 275 of file parallel.c.

3.88.2.4 rloser

```
int NoDe::rloser
```

Definition at line 276 of file parallel.c.

3.88.2.5 lsrc

```
int NoDe::lsrc
```

Definition at line 277 of file parallel.c.

3.88.2.6 rsrc

```
int NoDe::rsrc
```

Definition at line 278 of file parallel.c.

The documentation for this struct was generated from the following file:

- parallel.c

3.89 node Struct Reference

Collaboration diagram for node:

Public Member Functions

- node (const WORD *data)
- int cmp (const struct node *rhs) const
- bool operator() (const struct node *lhs, const struct node *rhs) const
- void calcHash ()

Data Fields

- const WORD * data
- struct node * l
- struct node * r
- WORD sign
- UWORD hash

3.89.1 Detailed Description

Definition at line 1495 of file optimize.cc.

3.89.2 Constructor & Destructor Documentation

3.89.2.1 node() [1/2]

```
node::node ( )  [inline]
```

Definition at line 1502 of file optimize.cc.

3.89.2.2 node() [2/2]

```
node::node (
            const WORD * data )  [inline]
```

Definition at line 1503 of file optimize.cc.

3.89.3 Member Function Documentation

3.89.3.1 cmp()

```
int node::cmp (
            const struct node * rhs ) const  [inline]
```

Definition at line 1507 of file optimize.cc.

3.89.3.2 operator()()

```
bool node::operator() (
            const struct node * lhs,
            const struct node * rhs ) const  [inline]
```

Definition at line 1531 of file optimize.cc.

3.89.3.3 calcHash()

```
void node::calcHash ( )  [inline]
```

Definition at line 1536 of file optimize.cc.

3.89.4 Field Documentation

3.89.4.1 data

```
const WORD* node::data
```

Definition at line 1496 of file optimize.cc.

3.89.4.2 l

```
struct node* node::l
```

Definition at line 1497 of file optimize.cc.

3.89.4.3 r

```
struct node* node::r
```

Definition at line 1498 of file optimize.cc.

3.89.4.4 sign

```
WORD node::sign
```

Definition at line 1499 of file optimize.cc.

3.89.4.5 hash

```
UWORD node::hash
```

Definition at line 1500 of file optimize.cc.

The documentation for this struct was generated from the following file:

- optimize.cc

3.90 NodeEq Struct Reference

Public Member Functions

- bool operator() (const NODE *lhs, const NODE *rhs) const

3.90.1 Detailed Description

Definition at line 1557 of file optimize.cc.

3.90.2 Member Function Documentation

3.90.2.1 operator()()

```
bool NodeEq::operator() (
            const NODE * lhs,
            const NODE * rhs ) const  [inline]
```

Definition at line 1558 of file optimize.cc.

The documentation for this struct was generated from the following file:

- optimize.cc

3.91 NodeHash Struct Reference

Public Member Functions

- size_t operator() (const NODE *n) const

3.91.1 Detailed Description

Definition at line 1551 of file optimize.cc.

3.91.2 Member Function Documentation

3.91.2.1 operator()()

```
size_t NodeHash::operator() (
            const NODE * n ) const  [inline]
```

Definition at line 1552 of file optimize.cc.

The documentation for this struct was generated from the following file:

Data Fields

- int type
- int arg1
- int arg2
- int improve
- vector< WORD > coeff
- vector< int > eqnidxs

3.97.1 Detailed Description

class Optimization

3.97.2 Description

This object represents an optimization. Its type is a number in the range 0 to 5. Depending on this type, the variables arg1, arg2 and coeff indicate:

type==0 : optimization of the form x[arg1] ^ arg2 (coeff=empty) type==1 : optimization of the form x[arg1] * x[arg2] (coeff=empty) type==2 : optimization of the form x[arg1] * coeff (arg2=0) type==3 : optimization of the form x[arg1] + coeff (arg2=0) type==4 : optimization of the form x[arg1] + x[arg2] (coeff=empty) type==5 : optimization of the form x[arg1] - x[arg2] (coeff=empty)

Here, "x[arg]" represents a symbol (if positive) or an extrasymbol (if negative). The represented symbol's id is ABS(x[arg])-1.

"eqns" is a list of equation, where this optimization can be performed.

"improve" is the total improvement of this optimization.

Definition at line 2669 of file optimize.cc.

3.97.3 Member Function Documentation

3.109.2.3 n

```
WORD PeRmUtE::n
```

Definition at line 1059 of file structs.h.

3.109.2.4 cycle

```
WORD PeRmUtE::cycle[MAXMATCH]
```

Definition at line 1060 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.110 PeRmUtEp Struct Reference

```
#include <structs.h>
```

Data Fields

- WORD ** objects
- WORD sign
- WORD n
- WORD cycle [MAXMATCH]

3.110.1 Detailed Description

Like struct PERM but works with pointers.

Definition at line 1067 of file structs.h.

3.110.2 Field Documentation

3.110.2.1 objects

```
WORD** PeRmUtEp::objects
```

Definition at line 1068 of file structs.h.

3.110.2.2 sign

```
WORD PeRmUtEp::sign
```

Definition at line 1069 of file structs.h.

3.110.2.3 n

```
WORD PeRmUtEp::n
```

Definition at line 1070 of file structs.h.

3.110.2.4 cycle

```
WORD PeRmUtEp::cycle[MAXMATCH]
```

Definition at line 1071 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.111 PF_BUFFER Struct Reference

```
#include <parallel.h>
```

Data Fields

- WORD ** buff
- WORD ** fill
- WORD ** full
- WORD ** stop
- MPI_Status * status
- MPI_Status * retstat
- MPI_Request * request
- MPI_Datatype * type
- int * index
- int * tag
- int * from
- int numbufs
- int active

3.111.1 Detailed Description

A struct for nonblocking, unbuffered send of the sorted terms in the PObuffers back to the master using several "rotating" PObuffers.

Definition at line 159 of file parallel.h.

3.111.2 Field Documentation

3.111.2.1 buff

```
WORD** PF_BUFFER::buff
```

Definition at line 160 of file parallel.h.

3.111.2.2 fill

```
WORD** PF_BUFFER::fill
```

Definition at line 161 of file parallel.h.

3.111.2.3 full

```
WORD** PF_BUFFER::full
```

Definition at line 162 of file parallel.h.

3.111.2.4 stop

```
WORD** PF_BUFFER::stop
```

Definition at line 163 of file parallel.h.

3.111.2.5 status

```
MPI_Status* PF_BUFFER::status
```

Definition at line 164 of file parallel.h.

3.111.2.6 retstat

```

```

Definition at line 2259 of file poly.cc.

3.116.3.23 is_dense_univariate()

```
int poly::is_dense_univariate ( ) const
```

Dense univariate detection

3.116.4 Description

This method returns whether the polynomial is dense and univariate. The possible return values are:

-2 is not dense univariate -1 is no variables n>=0 is univariate in n

3.116.5 Notes

A univariate polynomial is considered dense iff more than half of the coefficients a_0...a_deg are non-zero.

Definition at line 2284 of file poly.cc.

Referenced by divmod(), and mul().

3.116.5.1 sign()

```
int poly::sign ( ) const

Polynomial multiplication

3.116.6 Description

This routine determines which multiplication routine to use for multiplying two polynomials. The logic is as follows:

- If a or b consists of only one term, call mul_one_term;
- Otherwise, if both are univariate and dense, call mul_univar;
- Otherwise, call mul_heap.

Definition at line 1195 of file poly.cc.

```

Multiplication of polynomials with a heap

3.116.8 Description

Multiplies two multivariate polynomials. The next element of the product is efficiently determined by using a heap. If the product of the maximum power in all variables is small, a hash table is used to add equal terms for extra speed.

A heap element h is formatted as follows:

- h[0] = index in a
- h[1] = index in b
- h[2] = hash code (-1 if no hash is used)
- h[3] = length of coefficient with sign
- h[4...4+AN.poly_num_vars-1] = powers

- h[4+AN.poly_num_vars...4+h[3]-1] = coefficient

Definition at line 961 of file poly.cc.

            poly & q,
            poly & r,
            bool only_divides )  [static]
```

Definition at line 1245 of file poly.cc.

3.116.8.2 divmod_univar()

```
void poly::divmod_univar (
            const poly & a,
            const poly & b,
            poly & q,
            poly & r,
            int var,
            bool only_divides )  [static]
```

Division of dense univariate polynomials.

3.116.9 Description

Divides two dense univariate polynomials. For each power, the method collects all terms that result in that power.

Relevant formula [Q=A/B, P=SUM(p_i*x^i), n=deg(A), m=deg(B)]: q_k = [a_{m+k} - SUM(i=k+1...n-m, b_{m+k-i}*q_i)] / b_m

Definition at line 1376 of file poly.cc.

References GetModInverses(), and RaisPowCached().

Referenced by divmod().

3.116.9.1 divmod_heap()

```
void poly::divmod_heap (
             const poly & a,
             const poly & b,
             poly & q,
             poly & r,
             bool only_divides,
             bool check_div,
             bool & div_fail )  [static]
```

Division of polynomials with a heap

3.116.10 Description

Divides two multivariate polynomials. The next element of the quotient/remainder is efficiently determined by using a heap. If the product of the maximum power in all variables is small, a hash table is used to add equal terms for extra speed.

If the input flag check_div is set then if the result of any coefficient division results in a non-zero remainder (indicating that division has failed over the integers) the output flag div_fail will be set and the division will be terminated early (q, r will be incorrect). If check_div is not set then non-zero remainders from coefficient division will be written into r.

A heap element h is formatted as follows:

- h[0] = index in a
- h[1] = index in b
- h[2] = -1 (no hash is used)
- h[3] = length of coefficient with sign
- h[4...4+AN.poly_num_vars-1] = powers
- h[4+AN.poly_num_vars...4+h[3]-1] = coefficient

Note: the hashing trick as in multiplication cannot be used easily, since there is no tight upperbound on the exponents in the answer.

For details, see M. Monagan, "Polynomial Division using Dynamic Array, Heaps, and Packed Exponent Vectors"

3.124.1 Detailed Description

The R_const struct is part of the global data and resides either in the ALLGLOBALS struct A, or the ALLPRIVATES struct B (TFORM) under the name R We see it used with the macro AR as in AR.infile It has the variables that define the running environment and that should be transferred with a term in a multithreaded run.

```
WORD SeTs::flags
```

Definition at line 521 of file structs.h.

The documentation for this struct was generated from the following file:

- structs.h

3.128 SETUPPARAMETERS Struct Reference

```
#include <structs.h>
```

Data Fields

- UBYTE * parameter
- int type
- int flags
- LONG value

3.128.1 Detailed Description

Each setup parameter has one element of the struct SETUPPARAMETERS assigned to it. By binary search in the array of them we can then locate the proper element by name. We have to assume that two ints make a long and either one or two longs make a pointer. The long before the ints and padding gives a problem in the initialization.

Definition at line 1014 of file structs.h.

3.128.2 Field Documentation

3.128.2.1 parameter

```
UBYTE* SETUPPARAMETERS::parameter
```

Definition at line 1015 of file structs.h.

3.128.2.2 type

```
int SETUPPARAMETERS::type
```

Definition at line 1016 of file structs.h.

3.128.2.3 flags

```

3.131.1 Detailed Description

The struct SORTING is used to control a sort operation. It includes a small and a large buffer and arrays for keeping track of various stages of the (merge) sorts. Each sort level has its own struct and different levels can have different sizes for its arrays. Also different threads have their own set of SORTING structs.

- UBYTE sFun
- UBYTE maxpower [16]
- UBYTE wildoffset [16]
- UBYTE revision
- UBYTE reserved [512-8-4-16-4-16-16-1]

3.135.1 Detailed Description

Defines the structure of the file header for store-files and save-files.

The first 8 bytes serve as a unique mark to identity save-files that contain such a header. Older versions of FORM don't have this header and will write the POSITION of the next file index (struct FiLeInDeX) here, which is always different from this pattern.

It is always 512 bytes long.

Definition at line 75 of file structs.h.

3.135.2 Field Documentation

3.135.2.1 headermark

```
UBYTE STOREHEADER::headermark[8]
```

Pattern for header identification. Old versions of FORM have a maximum sizeof(POSITION) of 8

Definition at line 76 of file structs.h.

3.135.2.2 lenWORD

```
UBYTE STOREHEADER::lenWORD
```

Number of bytes for WORD

Definition at line 78 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.3 lenLONG

```
UBYTE STOREHEADER::lenLONG
```

Number of bytes for LONG

Definition at line 79 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.4 lenPOS

```
UBYTE STOREHEADER::lenPOS
```

Number of bytes for POSITION

Definition at line 80 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.5 lenPOINTER

```
UBYTE STOREHEADER::lenPOINTER
```

Number of bytes for void *

Definition at line 81 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.6 endianness

```
UBYTE STOREHEADER::endianness[16]
```

Used to determine endianness, sizeof(int) should be <= 16

Definition at line 82 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.7 sSym

```
UBYTE STOREHEADER::sSym
```

sizeof(struct SyMbOl)

Definition at line 83 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.8 sInd

`UBYTE STOREHEADER::sInd`

sizeof(struct InDeX)

Definition at line 84 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.9 sVec

`UBYTE STOREHEADER::sVec`

sizeof(struct VeCtOr)

Definition at line 85 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.10 sFun

`UBYTE STOREHEADER::sFun`

sizeof(struct FuNcTiOn)

Definition at line 86 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.11 maxpower

`UBYTE STOREHEADER::maxpower[16]`

Maximum power, see #MAXPOWER

Definition at line 87 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.12 wildoffset

`UBYTE STOREHEADER::wildoffset[16]`

#WILDOFFSET macro

Definition at line 88 of file structs.h.

Referenced by WriteStoreHeader().

3.135.2.13 revision

```
UBYTE STOREHEADER::revision
```

Revision number of save-file system

Definition at line 89 of file structs.h.

3.135.2.14 reserved

```
UBYTE STOREHEADER::reserved[512-8-4-16-4-16-16-1]
```

Padding to 512 bytes

Definition at line 90 of file structs.h.

The documentation for this struct was generated from the following file:

3.136.1 Detailed Description

Input is read from 'streams' which are represented by objects of type STREAM. A stream can be a file, a do-loop, a procedure, the string value of a preprocessor variable ..... When a new stream is opened we have to keep information about where to fall back in the parent stream to allow this to happen even in the middle of reading names etc as would be the case with a`i'b

3.141.1 Detailed Description

The T_const struct is part of the global data and resides either in the ALLGLOBALS struct A, or the ALLPRIVATES struct B (TFORM) under the name T We see it used with the macro AT as in AT.WorkPointer It has variables that are private to each thread, most of which have to be defined at startup.

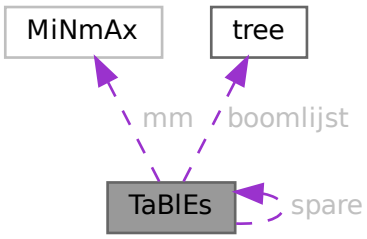
3.144 TaBIEs Struct Reference

`#include <structs.h>`

Collaboration diagram for TaBIEs:



Data Fields

- WORD * tablepointers
- WORD * prototype
- WORD * pattern
- MINMAX * mm
- WORD * flags
- COMPTREE * boomlijst
- UBYTE * argtail
- struct TaBIEs * spare
- WORD * buffers
- LONG totind
- LONG reserved
- LONG defined
- LONG mdefined
- int prototypeSize
- int numind
- int bounds
- int strict
- int sparse
- int numtree
- int rootnum
- int MaxTreeSize
- WORD bufnum
- WORD bufferssize
- WORD buffersfill
- WORD tablenum
- WORD mode
- WORD numdummies

3.144.1 Detailed Description

buffers, mm, flags, and prototype are always dynamically allocated, tablepointers only if needed (=0 if unallocated), boomlijst and argtail only for sparse tables.

Allocation is done for both the normal and the stub instance (spare), except for prototype and argtail which share memory.

Definition at line 342 of file structs.h.

3.144.2 Field Documentation

3.144.2.1 tablepointers

```
WORD* TaBlEs::tablepointers
```

[D] Start in tablepointers table.

Definition at line 343 of file structs.h.

3.144.2.2 prototype

```
WORD* TaBlEs::prototype
```

[D] The wildcard prototyping for arguments

Definition at line 348 of file structs.h.

Referenced by DoRecovery().

3.144.2.3 pattern

```
WORD* TaBlEs::pattern
```

The pattern with which to match the arguments

Definition at line 349 of file structs.h.

Referenced by DoRecovery().

3.144.2.4 mm

```
MINMAX* TaBlEs::mm
```

[D] Array bounds, dimension by dimension. # elements = numind.

Definition at line 351 of file structs.h.

Referenced by DoRecovery().

3.144.2.5 flags

```
WORD* TaBlEs::flags
```

[D] Is element in use ? etc. # elements = numind.

Definition at line 352 of file structs.h.

Referenced by DoRecovery().

3.144.2.6 boomlijst

```
COMPTREE* TaBlEs::boomlijst
```

[D] Tree for searching in sparse tables

Definition at line 353 of file structs.h.

Referenced by DoRecovery().

3.144.2.7 argtail

```
UBYTE* TaBlEs::argtail
```

[D] The arguments in characters. Starts for tablebase with parenthesis to indicate tail

Definition at line 354 of file structs.h.

Referenced by DoRecovery().

3.144.2.8 spare

```
struct TaBlEs* TaBlEs::spare
```

[D] For tablebase. Alternatingly stubs and real

Definition at line 356 of file structs.h.

Referenced by DoRecovery().

3.144.2.9 buffers

```
WORD* TaBlEs::buffers
```

[D] When we use more than one compiler buffer.

Definition at line 357 of file structs.h.

Referenced by AddRHS(), and DoRecovery().

3.144.2.10 totind

`LONG TaBlEs::totind`

Total number requested

Definition at line 358 of file structs.h.

Referenced by DoRecovery().

3.144.2.11 reserved

`LONG TaBlEs::reserved`

Total reservation in tablepointers for sparse

Definition at line 359 of file structs.h.

Referenced by DoRecovery().

3.144.2.12 defined

`LONG TaBlEs::defined`

Number of table elements that are defined

Definition at line 360 of file structs.h.

3.144.2.13 mdefined

`LONG TaBlEs::mdefined`

Same as defined but after .global

Definition at line 361 of file structs.h.

3.144.2.14 prototypeSize

`int TaBlEs::prototypeSize`

Size of allocated memory for prototype in bytes.

Definition at line 362 of file structs.h.

Referenced by DoRecovery().

3.144.2.15 numind

```
int TaBlEs::numind
```

Number of array indices

Definition at line 363 of file structs.h.

Referenced by DoRecovery().

3.144.2.16 bounds

```
int TaBlEs::bounds
```

Array bounds check on/off.

Definition at line 364 of file structs.h.

3.144.2.17 strict

```
int TaBlEs::strict
```

>0: all must be defined. <0: undefined not substitute

Definition at line 365 of file structs.h.

3.144.2.18 sparse

```
int TaBlEs::sparse
```

0 --> sparse table

Definition at line 366 of file structs.h.

Referenced by DoRecovery().

3.144.2.19 numtree

```
int TaBlEs::numtree
```

For the tree for sparse tables

Definition at line 367 of file structs.h.

3.144.2.20 rootnum

```
int TaBlEs::rootnum
```

For the tree for sparse tables

Definition at line 368 of file structs.h.

3.144.2.21 MaxTreeSize

```
int TaBlEs::MaxTreeSize
```

For the tree for sparse tables

Definition at line 369 of file structs.h.

Referenced by DoRecovery().

3.144.2.22 bufnum

```
WORD TaBlEs::bufnum
```

Each table potentially its own buffer

Definition at line 370 of file structs.h.

Referenced by AddRHS().

3.144.2.23 bufferssize

```
WORD TaBlEs::bufferssize
```

When we use more than one compiler buffer

Definition at line 371 of file structs.h.

Referenced by AddRHS(), and DoRecovery().

3.144.2.24 buffersfill

```
WORD TaBlEs::buffersfill
```

When we use more than one compiler buffer

Definition at line 372 of file structs.h.

Referenced by AddRHS().

3.144.2.25 tablenum

```
WORD TaBlEs::tablenum
```

For testing of tableuse

Definition at line 373 of file structs.h.

3.148.1 Detailed Description

The struct TRACES keeps track of the progress during the expansion of a 4-dimensional trace. Each time a term gets generated the expansion tree continues in the next statement. When it returns it has to know where to continue. The 4-dimensional traces are more complicated than the n-dimensional traces (see TRACEN) because of the extra tricks that can be used. They are responsible for the shorter final expressions.

The documentation for this struct was generated from the following file:

- structs.h

3.149 tree Struct Reference

```
#include <structs.h>
```

Data Fields

- int parent
- int left
- int right
- int value
- int blnce
- int usage

3.149.1 Detailed Description

The subexpressions in the compiler are kept track of in a (balanced) tree to reduce the need for subexpressions and hence save much space in large rhs expressions (like when we have xxxxxxx occurrences of objects like f(x+1,x+1) in which each x+1 becomes a subexpression. The struct that controls this tree is COMPTREE.

Definition at line 288 of file structs.h.

3.149.2 Field Documentation

3.149.2.1 parent

```
int tree::parent
```

Index of parent

Definition at line 289 of file structs.h.

Referenced by IniFbuffer().

3.149.2.2 left

`int tree::left`

Left child (if not -1)

Definition at line 290 of file structs.h.

Referenced by IniFbuffer().

3.149.2.3 right

`int tree::right`

Right child (if not -1)

Definition at line 291 of file structs.h.

Referenced by IniFbuffer().

3.149.2.4 value

`int tree::value`

The object to be sorted and searched

Definition at line 292 of file structs.h.

Referenced by IniFbuffer().

3.149.2.5 blnce

`int tree::blnce`

Balance factor

Definition at line 293 of file structs.h.

Referenced by IniFbuffer().

3.149.2.6 usage

`int tree::usage`

Number of uses in some types of trees

Definition at line 294 of file structs.h.

Referenced by CleanupArgCache(), and IniFbuffer().

4.1.1 Detailed Description

Contains the routines that deal with the execution phase of the argument and related statements (like term)

Definition in file argument.c.

4.1.2 Macro Definition Documentation

4.1.2.1 NEWORDER

```
#define NEWORDER
```

Factorizes an argument in general notation (meaning that the first word of the argument is a positive size indicator) Input (argin): pointer to the complete argument Output (argout): Pointer to where the output should be written. This is in the WorkSpace Return value should be negative if anything goes wrong.

The notation of the output should be a string of arguments terminated by the number zero.

Originally we sorted in a way that the constants came last. This gave conflicts with the dollar and expression factorizations (in the expressions we wanted the zero first and then followed by the constants).

Definition at line 2068 of file argument.c.

4.1.3 Function Documentation

4.1.3.1 execarg()

```
int execarg (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 56 of file argument.c.

4.1.3.2 execterm()

```
int execterm (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 1777 of file argument.c.

4.1.3.3 ArgumentImplode()

```
int ArgumentImplode (
            PHEAD WORD * term,
            WORD * thelist )
```

Definition at line 1853 of file argument.c.

4.1.3.4 ArgumentExplode()

```
int ArgumentExplode (
            PHEAD WORD * term,
            WORD * thelist )
```

Definition at line 1957 of file argument.c.

4.1.3.5 ArgFactorize()

```
int ArgFactorize (
            PHEAD WORD * argin,
            WORD * argout )
```

Definition at line 2070 of file argument.c.

4.1.3.6 FindArg()

```
WORD FindArg (
            PHEAD WORD * a )
```

Looks the argument up in the (workers) table. If it is found the number in the table is returned (plus one to make it positive). If it is not found we look in the compiler provided table. If it is found - the number in the table is returned (minus one to make it negative). If in neither table we return zero.

Definition at line 2525 of file argument.c.

4.1.3.7 InsertArg()

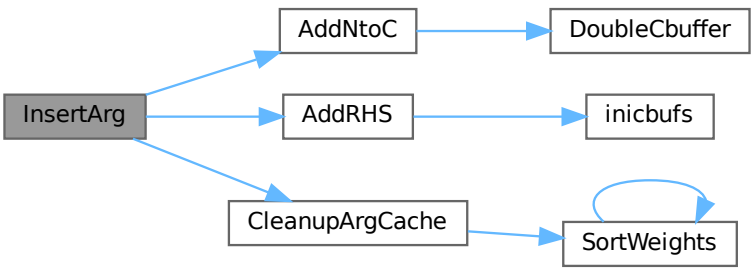
```
int InsertArg (
            PHEAD WORD * argin,
            WORD * argout,
            int par )
```

Inserts the argument into the (workers) table. If the table is too full we eliminate half of it. The eliminated elements are the ones that have not been used most recently, weighted by their total use and age(?). If par == 0 it inserts in the regular factorization cache If par == 1 it inserts in the cache defined with the FactorCache statement

Definition at line 2549 of file argument.c.

References AddNtoC(), AddRHS(), and CleanupArgCache().

Here is the call graph for this function:



4.1.3.8 CleanupArgCache()

```
int CleanupArgCache (
            PHEAD WORD bufnum )
```

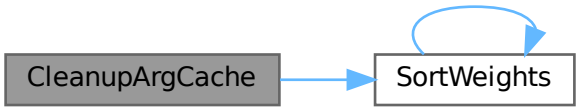
Cleans up the argument factorization cache. We throw half the elements. For a weight of what we want to keep we use the product of usage and the number in the buffer.

Definition at line 2584 of file argument.c.

References CbUf::boomlijst, CbUf::Buffer, CbUf::Pointer, CbUf::rhs, SortWeights(), and tree::usage.

Referenced by InsertArg().

Here is the call graph for this function:



4.1.3.9 ArgSymbolMerge()

```
int ArgSymbolMerge (
            WORD * t1,
            WORD * t2 )
```

Definition at line 2655 of file argument.c.

4.1.3.10 ArgDotproductMerge()

```
int ArgDotproductMerge (
            WORD * t1,
            WORD * t2 )
```

Definition at line 2710 of file argument.c.

4.1.3.11 TakeArgContent()

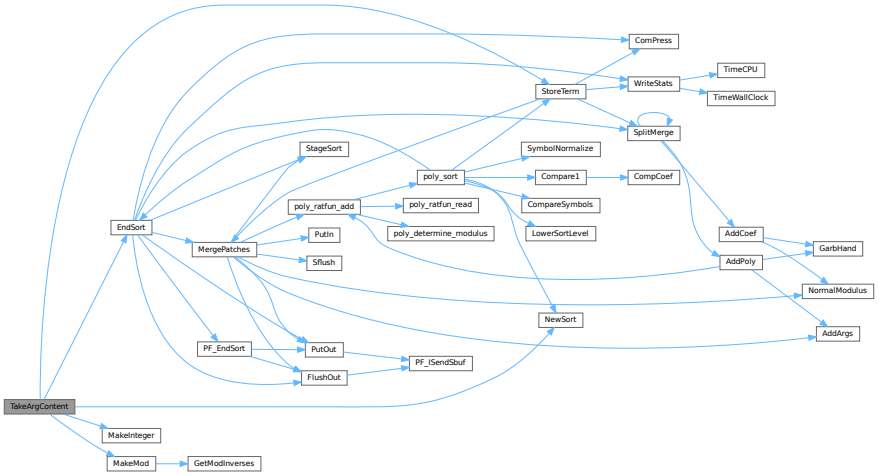
```
WORD * TakeArgContent (
            PHEAD WORD * argin,
            WORD * argout )
```

Implements part of the old ExecArg in which we take common factors from arguments with more than one term. The common pieces are put in argout as a sequence of arguments. The part with the multiple terms that are now relative prime is put in argfree which is allocated via TermMalloc and is given as the return value. The difference with the old code is that negative powers are always removed. Hence it is as in MakeInteger in which only numerators will be left: now only zero or positive powers will be remaining.

Definition at line 2778 of file argument.c.

References EndSort(), MakeInteger(), MakeMod(), NewSort(), and StoreTerm().

Here is the call graph for this function:



4.1.3.12 MakeInteger()

```
WORD * MakeInteger (
            PHEAD WORD * argin,
            WORD * argout,
            WORD * argfree )
```

For normalizing everything to integers we have to determine for all elements of this argument the LCM of the denominators and the GCD of the numerators. The input argument is in argin. The number that comes out should go to argout. The new pointer in the argout buffer is the return value. The normalized argument is in argfree.

Definition at line 3328 of file argument.c.

Referenced by TakeArgContent().

4.1.3.13 MakeMod()

```
WORD * MakeMod (
            PHEAD WORD * argin,
            WORD * argout,
            WORD * argfree )
```

Similar to MakeInteger but now with modulus arithmetic using only a one WORD 'prime'. We make the coefficient of the first term in the argument equal to one. Already the coefficients are taken modulus AN.cmod and AN.ncmod == 1

Definition at line 3499 of file argument.c.

References GetModInverses().

Referenced by TakeArgContent().

Here is the call graph for this function:

4.1.3.14 SortWeights()

```
void SortWeights (
            LONG * weights,
            LONG * extraspace,
            WORD number )
```

Sorts an array of LONGS in the same way SplitMerge (in sort.c) works We use gradual division in two.

Definition at line 3544 of file argument.c.

References SortWeights().

Referenced by CleanupArgCache(), and SortWeights().

Here is the call graph for this function:

4.5.1 Detailed Description

Contains all functions that deal with the recovery mechanism controlled and activated by the On Checkpoint switch.

The main function are DoCheckpoint, DoRecovery, and DoSnapshot. If the checkpoints are activated DoCheckpoint is called every time a module is finished executing. If the conditions for the creation of a recovery snapshot are met DoCheckpoint calls DoSnapshot. DoRecovery is called once when FORM starts up with the command line argument -R. Most of the other code contains debugging facilities that are only compiled if the macro PRINTDEBUG is defined.

The recovery mechanism is atomic, i.e. only if everything went well, the final recovery file is created (and the older one overwritten) in a single step (copying). If some errors occur, a warning is issued and the program continues without having created a new recovery file. The only situation in which the creation of the recovery data leads to a termination of the running program is if not enough disk or memory space is left.

For ParFORM each slave creates its own recovery file, sends it to the master and then it deletes the recovery file. The master stores all the recovery files and on recovery it feeds these files to the slaves. It is nearly impossible to recover after some MPI fault so ParFORM terminates on any recovery failure.

DoRecovery and DoSnapshot do the loading and saving of the recovery data, respectively. Every change in one functions needs to be accompanied by the appropriate change in the other function. The structure of both functions is quite similar. They handle the relevant global structs one after the other and then care about the copying of the hide and scratch files.

The names of the recovery, scratch and hide files are hard-coded in the variables in fold "filenames and system commands".

If the global structs AM,AP,AC,AR are changed, DoRecovery and DoSnapshot usually also have to be changed. Some structs are read/written as a whole (AP,AC), some are read/written only partly as a selection of their individual elements (AM,AR). If AM or AR have been changed by adding or removing an element that is important for the runtime status, then the reading/writing statements have to be added to or removed from DoRecovery and Do↩ Snapshot. If AP or AC are changed, then for non-pointer variables (in the case of a struct it also means that none of its elements is a pointer) nothing has to be changed in the functions here. If pointers are involved, extra code has to be added (or removed). See the comments of DoRecovery and DoSnapshot.

4.5.2 Macro Definition Documentation

4.5.2.1 CACHED_SNAPSHOT

```
#define CACHED_SNAPSHOT
```

Definition at line 1214 of file checkpoint.c.

4.5.2.2 CACHE_SIZE

```
#define CACHE_SIZE 4096
```

Definition at line 1216 of file checkpoint.c.

4.5.2.3 R_FREE

```
#define R_FREE(
              ARG )  if ( ARG ) M_free(ARG, #ARG);
```

Definition at line 1281 of file checkpoint.c.

4.5.2.4 R_FREE_NAMETREE

```
#define R_FREE_NAMETREE(
              ARG )
```

Value:

```
    R_FREE(ARG->namenode); \
    R_FREE(ARG->namebuffer); \
    R_FREE(ARG);
```

Definition at line 1284 of file checkpoint.c.

4.5.2.5 R_FREE_STREAM

```
#define R_FREE_STREAM(
              ARG )
```

Value:

```
    R_FREE(ARG.buffer); \
    R_FREE(ARG.FoldName); \
    R_FREE(ARG.name);
```

Definition at line 1289 of file checkpoint.c.

4.5.2.6 R_SET

```
#define R_SET(
              VAR,
              TYPE )  VAR = *((TYPE*)p); p = (unsigned char*)p + sizeof(TYPE);
```

Definition at line 1296 of file checkpoint.c.

4.5.2.7 R_COPY_B

```
#define R_COPY_B(
                VAR,
                SIZE,
                CAST )
```

Value:

```
    VAR = (CAST)Malloc1(SIZE,#VAR); \
    memcpy(VAR, p, SIZE); p = (unsigned char*)p + SIZE;
```

Definition at line 1301 of file checkpoint.c.

4.5.2.8 S_WRITE_B

```
#define S_WRITE_B(
                BUF,
                LEN )  if ( fwrite_cached(BUF, 1, LEN, fd) != (size_t)(LEN) ) return(__LINE__);
```

Definition at line 1305 of file checkpoint.c.

4.5.2.9 S_FLUSH_B

```
#define S_FLUSH_B  if ( flush_cache(fd) != 1 ) return(__LINE__);
```

Definition at line 1308 of file checkpoint.c.

4.5.2.10 R_COPY_S

```
#define R_COPY_S(
                VAR,
                CAST )
```

Value:

```
    if ( VAR ) { \
        VAR = (CAST)Malloc1(strlen(p)+1,"R_COPY_S"); \
        strcpy((char*)VAR, p); p = (unsigned char*)p + strlen(p) + 1; \
    }
```

Definition at line 1313 of file checkpoint.c.

4.5.2.11 S_WRITE_S

```
#define S_WRITE_S(
                STR )
```

Value:

```
    if ( STR ) { \
        l = strlen((char*)STR) + 1; \
        if ( fwrite_cached(STR, 1, l, fd) != (size_t)l ) return(__LINE__); \
    }
```

Definition at line 1319 of file checkpoint.c.

4.5.2.12 R_COPY_LIST

```
#define R_COPY_LIST(
                ARG )
```

Value:

```
    if ( ARG.maxnum ) { \
        R_COPY_B(ARG.lijst, ARG.size*ARG.maxnum, void*) \
    }
```

Definition at line 1327 of file checkpoint.c.

4.5.2.13 S_WRITE_LIST

```
#define S_WRITE_LIST(
                LST )
```

Value:

```
    if ( LST.maxnum ) { \
        S_WRITE_B((char*)LST.lijst, LST.maxnum*LST.size) \
    }
```

Definition at line 1332 of file checkpoint.c.

4.5.2.14 R_COPY_NAMETREE

```
#define R_COPY_NAMETREE(
                ARG )
```

Value:

```
    R_COPY_B(ARG, sizeof(NAMETREE), NAMETREE*); \
    if ( ARG->namenode ) { \
        R_COPY_B(ARG->namenode, ARG->nodesize*sizeof(NAMENODE), NAMENODE*); \
    } \
    if ( ARG->namebuffer ) { \
        R_COPY_B(ARG->namebuffer, ARG->namesize, UBYTE*); \
    }
```

Definition at line 1339 of file checkpoint.c.

4.5.2.15 S_WRITE_NAMETREE

```
#define S_WRITE_NAMETREE(
                ARG )
```

Value:

```
    S_WRITE_B(ARG, sizeof(NAMETREE)); \
    if ( ARG->namenode ) { \
        S_WRITE_B(ARG->namenode, ARG->nodesize*sizeof(struct NaMeNode)); \
    } \
    if ( ARG->namebuffer ) { \
        S_WRITE_B(ARG->namebuffer, ARG->namesize); \
    }
```

Definition at line 1348 of file checkpoint.c.

4.5.2.16 S_WRITE_DOLLAR

```
#define S_WRITE_DOLLAR(
              ARG )
```

Value:

```
    if ( ARG.size && ARG.where && ARG.where != &(AM.dollarzero) ) { \
        S_WRITE_B(ARG.where, ARG.size*sizeof(WORD)) \
    }
```

Definition at line 1359 of file checkpoint.c.

4.5.2.17 ANNOUNCE

```
#define ANNOUNCE(
              str )
```

Definition at line 1370 of file checkpoint.c.

4.5.3 Function Documentation

4.5.3.1 CheckRecoveryFile()

```
int CheckRecoveryFile (
             void  )
```

Checks whether a snapshot/recovery file exists. Returns 1 if it exists, 0 otherwise.

Definition at line 278 of file checkpoint.c.

References RecoveryFilename().

Here is the call graph for this function:

4.5.3.2 DeleteRecoveryFile()

```
void DeleteRecoveryFile (
             void  )
```

Deletes the recovery files. It is called by CleanUp() in the case of a successful completion.

Definition at line 333 of file checkpoint.c.

4.5.3.3 RecoveryFilename()

```
char * RecoveryFilename (
            void  )
```

Returns pointer to recovery filename.

Definition at line 364 of file checkpoint.c.

Referenced by CheckRecoveryFile(), and DoRecovery().

4.5.3.4 InitRecovery()

```
void InitRecovery (
            void  )
```

Sets up the strings for the filenames of the recovery files. This functions should only be called once to avoid memory leaks and after AM.TempDir has been initialized.

Definition at line 399 of file checkpoint.c.

4.5.3.5 fwrite_cached()

```
size_t fwrite_cached (
            const void * ptr,
            size_t size,
            size_t nmemb,
            FILE * fd )
```

Definition at line 1222 of file checkpoint.c.

4.5.3.6 flush_cache()

```
size_t flush_cache (
            FILE * fd )
```

Definition at line 1247 of file checkpoint.c.

4.5.3.7 DoRecovery()

```
int DoRecovery (
            int * moduletype )
```

Reads from the recovery file and restores all necessary variables and states in FORM, so that the execution can recommence in preprocessor() as if no restart of FORM had occurred.

The recovery file is read into memory as a whole. The pointer p then points into this memory at the next non-processed data. The macros by which variables are restored, like R_SET, automatically increase p appropriately.

If something goes wrong, the function returns with a non-zero value.

Allocated memory that would be lost when overwriting the global structs with data from the file is freed first. A major part of the code deals with the restoration of pointers. The idiom we use is to memorize the original pointer value (org), allocate new memory and copy the data from the file into this memory, calculate the offset between the old pointer value and the new allocated memory position (ofs), and then correct all affected pointers (+=ofs).

We rely on the fact that several variables (especially in AM) are already assigned the correct values by the startup functions. That means, in principle, that a change in the setup files between snapshot creation and recovery will be noticed.

Definition at line 1402 of file checkpoint.c.

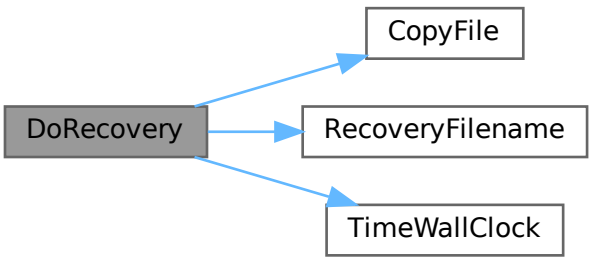
Here is the call graph for this function:



4.5.3.8 DoCheckpoint()

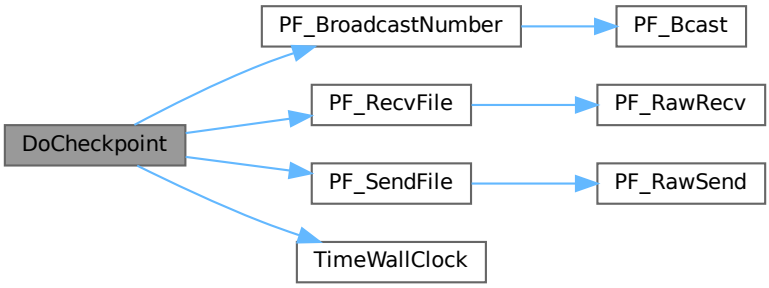
```
void DoCheckpoint (
            int moduletype )
```

Checks whether a snapshot should be done. Calls DoSnapshot() to create the snapshot.

Definition at line 3122 of file checkpoint.c.

References PF_BroadcastNumber(), PF_RecvFile(), PF_SendFile(), and TimeWallClock().

Here is the call graph for this function:



4.5.4 Variable Documentation

4.5.4.1 cache_buffer

```
unsigned char cache_buffer[CACHE_SIZE]
```

Definition at line 1219 of file checkpoint.c.

4.5.4.2 cache_fill

```
size_t cache_fill = 0
```

Definition at line 1220 of file checkpoint.c.

4.7.1 Detailed Description

Compiler routines for statements that involve algebraic expressions. These involve definitions, id-statements, the multiply statement and the fill statement.

Definition in file comexpr.c.

4.7.2 Function Documentation

4.7.2.1 CoLocal()

```
int CoLocal (
            UBYTE * inp )
```

Definition at line 66 of file comexpr.c.

4.7.2.2 CoGlobal()

```
int CoGlobal (
            UBYTE * inp )
```

Definition at line 73 of file comexpr.c.

4.7.2.3 CoLocalFactorized()

```
int CoLocalFactorized (
            UBYTE * inp )
```

Definition at line 80 of file comexpr.c.

4.7.2.4 CoGlobalFactorized()

```
int CoGlobalFactorized (
            UBYTE * inp )
```

Definition at line 87 of file comexpr.c.

4.7.2.5 DoExpr()

```
int DoExpr (
            UBYTE * inp,
            int type,
            int par )
```

Definition at line 96 of file comexpr.c.

4.7.2.6 CoIdOld()

```
int CoIdOld (
            UBYTE * inp )
```

Definition at line 387 of file comexpr.c.

4.7.2.7 CoId()

```
int CoId (
            UBYTE * inp )
```

Definition at line 398 of file comexpr.c.

4.7.2.8 CoIdNew()

```
int CoIdNew (
            UBYTE * inp )
```

Definition at line 409 of file comexpr.c.

4.7.2.9 CoDisorder()

```
int CoDisorder (
            UBYTE * inp )
```

Definition at line 420 of file comexpr.c.

4.7.2.10 CoMany()

```
int CoMany (
            UBYTE * inp )
```

Definition at line 431 of file comexpr.c.

4.7.2.11 CoMulti()

```
int CoMulti (
            UBYTE * inp )
```

Definition at line 442 of file comexpr.c.

4.7.2.12 CoIfMatch()

```
int CoIfMatch (
            UBYTE * inp )
```

Definition at line 453 of file comexpr.c.

4.7.2.13 CoIfNoMatch()

```
int CoIfNoMatch (
            UBYTE * inp )
```

Definition at line 464 of file comexpr.c.

4.7.2.14 CoOnce()

```
int CoOnce (
            UBYTE * inp )
```

Definition at line 475 of file comexpr.c.

4.7.2.15 CoOnly()

```
int CoOnly (
            UBYTE * inp )
```

Definition at line 486 of file comexpr.c.

4.7.2.16 CoSelect()

```
int CoSelect (
            UBYTE * inp )
```

Definition at line 497 of file comexpr.c.

4.7.2.17 CoIdExpression()

```
int CoIdExpression (
            UBYTE * inp,
            int type )
```

Definition at line 510 of file comexpr.c.

4.7.2.18 CoMultiply()

```
int CoMultiply (
            UBYTE * inp )
```

Definition at line 1034 of file comexpr.c.

4.7.2.19 CoFill()

```
int CoFill (
            UBYTE * inp )
```

Definition at line 1073 of file comexpr.c.

4.7.2.20 CoFillExpression()

```
int CoFillExpression (
            UBYTE * inp )
```

Definition at line 1359 of file comexpr.c.

4.7.2.21 CoPrintTable()

```
int CoPrintTable (
            UBYTE * inp )
```

Definition at line 1753 of file comexpr.c.

4.7.2.22 CoAssign()

```
int CoAssign (
            UBYTE * inp )
```

Definition at line 1929 of file comexpr.c.

4.7.2.23 CoDeallocateTable()

```
int CoDeallocateTable (
            UBYTE * inp )
```

Definition at line 1987 of file comexpr.c.

4.9.1 Detailed Description

Compiler routines for most statements that don't involve algebraic expressions. Exceptions: all routines involving declarations are in the file names.c When making new statements one can add the compiler routines here and have a look whether there is already a routine that is similar. In that case one can make a copy and modify it.

4.9.2 Function Documentation

4.9.2.1 CoFormat()

```
int CoFormat (
            UBYTE * s )
```

Definition at line 157 of file compcomm.c.

4.9.2.2 CoCollect()

```
int CoCollect (
            UBYTE * s )
```

Definition at line 437 of file compcomm.c.

4.9.2.3 setonoff()

```
int setonoff (
            UBYTE * s,
            int * flag,
            int onvalue,
            int offvalue )
```

Definition at line 499 of file compcomm.c.

4.9.2.4 CoCompress()

```
int CoCompress (
            UBYTE * s )
```

Definition at line 515 of file compcomm.c.

4.9.2.5 CoFlags()

```
int CoFlags (
            UBYTE * s,
            int value )
```

Definition at line 564 of file compcomm.c.

4.9.2.6 CoOff()

```
int CoOff (
            UBYTE * s )
```

Definition at line 599 of file compcomm.c.

4.9.2.7 CoOn()

```
int CoOn (
            UBYTE * s )
```

Definition at line 665 of file compcomm.c.

4.9.2.8 CoInsideFirst()

```
int CoInsideFirst (
            UBYTE * s )
```

Definition at line 937 of file compcomm.c.

4.9.2.9 CoProperCount()

```
int CoProperCount (
            UBYTE * s )
```

Definition at line 944 of file compcomm.c.

4.9.2.10 CoDelete()

```
int CoDelete (
            UBYTE * s )
```

Definition at line 951 of file compcomm.c.

4.9.2.11 CoKeep()

```
int CoKeep (
            UBYTE * s )
```

Definition at line 998 of file compcomm.c.

4.9.2.12 CoFixIndex()

```
int CoFixIndex (
            UBYTE * s )
```

Definition at line 1010 of file compcomm.c.

4.9.2.13 CoMetric()

```
int CoMetric (
            UBYTE * s )
```

Definition at line 1044 of file compcomm.c.

4.9.2.14 DoPrint()

```
int DoPrint (
            UBYTE * s,
            int par )
```

Definition at line 1052 of file compcomm.c.

4.9.2.15 CoPrint()

```
int CoPrint (
            UBYTE * s )
```

Definition at line 1268 of file compcomm.c.

4.9.2.16 CoPrintB()

```
int CoPrintB (
            UBYTE * s )
```

Definition at line 1275 of file compcomm.c.

4.9.2.17 CoNPrint()

```
int CoNPrint (
            UBYTE * s )
```

Definition at line 1282 of file compcomm.c.

4.9.2.18 CoPushHide()

```
int CoPushHide (
            UBYTE * s )
```

Definition at line 1289 of file compcomm.c.

4.9.2.19 CoPopHide()

```
int CoPopHide (
            UBYTE * s )
```

Definition at line 1333 of file compcomm.c.

4.9.2.20 SetExprCases()

```
int SetExprCases (
            int par,
            int setunset,
            int val )
```

Definition at line 1368 of file compcomm.c.

4.9.2.21 SetExpr()

```
int SetExpr (
            UBYTE * s,
            int setunset,
            int par )
```

Definition at line 1523 of file compcomm.c.

4.9.2.22 CoDrop()

```
int CoDrop (
            UBYTE * s )
```

Definition at line 1568 of file compcomm.c.

4.9.2.23 CoNoDrop()

```
int CoNoDrop (
            UBYTE * s )
```

Definition at line 1575 of file compcomm.c.

4.9.2.24 CoSkip()

```
int CoSkip (
            UBYTE * s )
```

Definition at line 1582 of file compcomm.c.

4.9.2.25 CoNoSkip()

```
int CoNoSkip (
            UBYTE * s )
```

Definition at line 1589 of file compcomm.c.

4.9.2.26 CoHide()

```
int CoHide (
            UBYTE * inp )
```

Definition at line 1596 of file compcomm.c.

4.9.2.27 CoIntoHide()

```
int CoIntoHide (
            UBYTE * inp )
```

Definition at line 1614 of file compcomm.c.

4.9.2.28 CoNoIntoHide()

```
int CoNoIntoHide (
            UBYTE * inp )
```

Definition at line 1632 of file compcomm.c.

4.9.2.29 CoNoHide()

```
int CoNoHide (
            UBYTE * inp )
```

Definition at line 1639 of file compcomm.c.

4.9.2.30 CoUnHide()

```
int CoUnHide (
            UBYTE * inp )
```

Definition at line 1646 of file compcomm.c.

4.9.2.31 CoNoUnHide()

```
int CoNoUnHide (
            UBYTE * inp )
```

Definition at line 1653 of file compcomm.c.

4.9.2.32 AddToCom()

```
void AddToCom (
             int n,
             WORD * array )
```

Definition at line 1660 of file compcomm.c.

4.9.2.33 AddComString()

```
int AddComString (
             int n,
             WORD * array,
             UBYTE * thestring,
             int par )
```

Definition at line 1675 of file compcomm.c.

4.9.2.34 Add2ComStrings()

```
int Add2ComStrings (
             int n,
             WORD * array,
             UBYTE * string1,
             UBYTE * string2 )
```

Definition at line 1734 of file compcomm.c.

4.9.2.35 CoDiscard()

```
int CoDiscard (
             UBYTE * s )
```

Definition at line 1775 of file compcomm.c.

4.9.2.36 CoContract()

```
int CoContract (
             UBYTE * s )
```

Definition at line 1798 of file compcomm.c.

4.9.2.37 CoGoTo()

```
int CoGoTo (

04034     #] CoMultiBracket :
04035     #[ CountComp :
04036
04037         This routine reads the count statement. The syntax is:
04038         count minimum,object,size[,object,size]
04039         Objects can be:
04040             symbol
04041             dotproduct
04042             vector
04043             function
04044         Vectors can have the auxiliary flags:
04045             +v +f +d +?setname
04046
04047         Output for the compiler:
04048         TYPECOUNT,size,minimum,objects
04049         with the objects:
04050         SYMBOL,4,number,size
04051         DOTPRODUCT,5,v1,v2,size
04052         FUNCTION,4,number,size
04053         VECTOR,5,number,bits,size or VECTOR,6,number,bits,setnumber,size
04054
04055         Currently only used in the if statement

4.11.1 Detailed Description

The heart of the compiler. It contains the tables of statements. It finds the statements in the tables and calls the proper routines. For algebraic expressions it runs the compilation by first calling the tokenizer, splitting things into subexpressions and generating the code. There is a system for recognizing already existing subexpressions. This economizes on the length of the output.

Note: the compiler of FORM doesn't attempt to normalize the input. Hence x+1 and 1+x are different objects during compilation. Similarly (a+b-b) will not be simplified to (a).

4.11.2 Macro Definition Documentation

4.11.2.1 OPTION0

```
#define OPTION0 1
```

Definition at line 260 of file compiler.c.

4.11.2.2 OPTION1

```
#define OPTION1 2
```

Definition at line 261 of file compiler.c.

4.11.2.3 OPTION2

```
#define OPTION2 3
```

Definition at line 262 of file compiler.c.

4.11.2.4 REDUCESUBEXPBUFFERS

```
#define REDUCESUBEXPBUFFERS
```

Value:

```
    { if ( (topsubexpbuffers-subexpbuffers) > 256 ) {\
    M_free(subexpbuffers,"subexpbuffers");\
    subexpbuffers = (SUBBUF *)Malloc1(256*sizeof(SUBBUF),"subexpbuffers");\
    topsubexpbuffers = subexpbuffers+256; } insubexpbuffers = 0; }
```

4.11.3 Function Documentation

4.11.3.1 inictable()

```
void inictable (
            void  )
```

Definition at line 315 of file compiler.c.

4.11.3.2 findcommand()

```
KEYWORD * findcommand (
            UBYTE * in )
```

Definition at line 341 of file compiler.c.

4.11.3.3 ParenthesesTest()

```
int ParenthesesTest (
            UBYTE * sin )
```

Definition at line 385 of file compiler.c.

4.11.3.4 SkipAName()

```
UBYTE * SkipAName (
            UBYTE * s )
```

Skips a name and gives a pointer to the character after the name. If there is not a proper name, it emits a compiler message and then returns a null pointer. This function supports formal names (e.g., `[x+a]`) and $-variables in addition to ordinary identifiers.

Note

The brackets are assumed to be matched already.

Parameters

in	*s*	Pointer to a null-terminated input string that starts with a name.

Returns

Pointer to the character after the name, or a null pointer if the name is invalid.

Definition at line 443 of file compiler.c.

4.11.3.5 IsRHS()

```
UBYTE * IsRHS (
            UBYTE * s,
            UBYTE c )
```

Definition at line 476 of file compiler.c.

4.11.3.6 IsIdStatement()

```
int IsIdStatement (
            UBYTE * s )
```

Definition at line 522 of file compiler.c.

4.11.3.7 CompileAlgebra()

```
int CompileAlgebra (
            UBYTE * s,
            int leftright,
            WORD * prototype )
```

Definition at line 536 of file compiler.c.

4.11.3.8 CompileStatement()

```
int CompileStatement (
            UBYTE * in )
```

Definition at line 572 of file compiler.c.

4.11.3.9 TestTables()

```
int TestTables (
            void  )
```

Definition at line 706 of file compiler.c.

4.11.3.10 CompileSubExpressions()

```
int CompileSubExpressions (
            SBYTE * tokens )
```

Definition at line 750 of file compiler.c.

4.11.3.11 CodeGenerator()

```
int CodeGenerator (
            SBYTE * tokens )
```

Definition at line 885 of file compiler.c.

4.11.3.12 CompleteTerm()

```
int CompleteTerm (
            WORD * term,
            UWORD * numer,
            UWORD * denom,
            WORD nnum,
            WORD nden,
            int sign )
```

Definition at line 1962 of file compiler.c.

4.11.3.13 CodeFactors()

```
int CodeFactors (
            SBYTE * tokens )
```

Definition at line 1999 of file compiler.c.

4.11.3.14 GenerateFactors()

```
WORD GenerateFactors (
            WORD n,
            WORD inc )
```

Definition at line 2300 of file compiler.c.

4.11.4 Variable Documentation

4.11.4.1 alfatable1

```
int alfatable1[27]
```

Definition at line 258 of file compiler.c.

4.11.4.2 subexpbuffers

```
SUBBUF* subexpbuffers = 0
```

Definition at line 269 of file compiler.c.

4.11.4.3 topsubexpbuffers

```
SUBBUF* topsubexpbuffers = 0
```

Definition at line 270 of file compiler.c.

4.11.4.4 insubexpbuffers

```
LONG insubexpbuffers = 0
```

Definition at line 271 of file compiler.c.

00860         #[ CodeGenerator :
00861
00862         This routine does the real code generation.
00863         It returns the number of the rhs subexpression.
00864         At this point we do not have to worry about subexpressions,
00865         sets, setelements, simple vs complicated function arguments
00866         simple vs complicated powers etc.
00867
00868         The variable 'first' indicates whether we are starting a new term
00869
00870         The major complication are the set elements of type set[n].
00871         We have marked them as TSETNUM,n,Ttype,setnum
00872         They go into
00873         SETSET,size,subterm,relocation list
00874         in which the subterm should be ready to become a regular
00875         subterm in which the sets have been replaced by their element
00876         The relocation list consists of pairs of numbers:
00877         1: offset in the subterm, 2: the symbol n.
00878         Note that such a subterm can be a whole function with its arguments.
00879         We use the variable inset to indicate that we have something going.
00880         The relocation list is collected in the top of the WorkSpace.

01983
01984         This routine does the part of reading in in terms of factors.
01985         If there is more than one term at this level we have only one
01986         factor. In that case any expression should first be unfactorized.
01987         Then the whole expression gets read as a new subexpression and finally
01988         we generate factor_*subexpression.
01989         If the whole has only multiplications we have factors. Then the
01990         nasty thing is powers of objects and in particular powers of
01991         factorized expressions or dollars.
01992         For a power we generate a new subexpression of the type
01993           1+factor_+...+factor_^(power-1)
01994         with which we multiply.

00035
00036 #ifdef WITHZLIB
00037 /*
00038 #define GZIPDEBUG
00039
00040     Low level routines for dealing with zlib during sorting and handling
00041     the scratch files. Work started 5-sep-2005.
00042     The .sor file handling was more or less completed on 8-sep-2005
00043     The handling of the scratch files still needs some thinking.
00044     Complications are:
00045         gzip compression should be per expression, not per buffer.
00046         No gzip compression for expressions with a bracket index.
00047         Separate decompression buffers for expressions in the rhs.
00048         This last one will involve more buffer work and organization.
00049         Information about compression should be stored for each expr.
```

```
00050             (including what method/program was used)
00051     Note: Be careful with compression. By far the most compact method
00052     is the original problem....
00053
00054     #[ Variables :
00055
00056     The following variables are to contain the intermediate buffers
00057     for the inflation of the various patches in the sort file.
00058     There can be up to MaxFpatches (FilePatches in the setup) and hence
00059     we can have that many streams simultaneously. We set this up once
00060     and only when needed.
00061         (in struct A.N or AB[threadnum].N)

4.15.1 Detailed Description

Utility routines for the compiler.

Definition in file comtool.c.

4.15.2 Function Documentation

4.15.2.1 inicbufs()

```
int inicbufs (
            void  )
```

Creates a new compiler buffer and returns its ID number.

Returns

The ID number for the new compiler buffer.

Definition at line 47 of file comtool.c.

References CbUf::boomlijst, CbUf::Buffer, CbUf::BufferSize, CbUf::CanCommu, CbUf::dimension, CbUf::lhs, CbUf::numdum, CbUf::NumTerms, CbUf::Pointer, CbUf::rhs, and CbUf::Top.

Referenced by AddRHS(), and StartVariables().

4.15.2.2 finishcbuf()

```
void finishcbuf (
            WORD num )
```

Frees a compiler buffer.

Parameters

num	The ID number for the buffer to be freed.

Definition at line 89 of file comtool.c.

References CbUf::boomlijst, CbUf::Buffer, CbUf::BufferSize, CbUf::CanCommu, CbUf::lhs, CbUf::NumTerms, CbUf::Pointer, CbUf::rhs, and CbUf::Top.

Referenced by PF_BroadcastCBuf().

4.15.2.3 clearcbuf()

```
void clearcbuf (
            WORD num )
```

Clears contents in a compiler buffer.

Parameters

num	The ID number for the buffer to be cleared.

Definition at line 116 of file comtool.c.

References CbUf::boomlijst, CbUf::Buffer, CbUf::Pointer, and CbUf::rhs.

4.15.2.4 DoubleCbuffer()

```
WORD * DoubleCbuffer (
            int num,
            WORD * w,
            int par )
```

Doubles a compiler buffer.

Parameters

num	The ID number for the buffer to be doubled.
w	The pointer to the end (exclusive) of the current buffer. The contents in the range of [cbuf[num].Buffer,w) will be kept.

Definition at line 143 of file comtool.c.

References CbUf::Buffer, CbUf::BufferSize, CbUf::lhs, CbUf::Pointer, CbUf::rhs, and CbUf::Top.

Referenced by AddNtoC(), and AddNtoL().

4.15.2.5 AddLHS()

```
WORD * AddLHS (
            int num )
```

Adds an LHS to a compiler buffer and returns the pointer to a buffer for the new LHS.

Parameters

num	The ID number for the buffer to get another LHS.

Definition at line 184 of file comtool.c.

References CbUf::lhs, and CbUf::Pointer.

Referenced by AddNtoL().

4.15.2.6 AddRHS()

```
WORD * AddRHS (
            int num,
            int type )
```

Adds an RHS to a compiler buffer and returns the pointer to a buffer for the new RHS.

Parameters

num	The ID number for the buffer to get another RHS.
type	If 0, the subexpression tree will be reallocated.

Definition at line 210 of file comtool.c.

References TaBIEs::buffers, TaBIEs::buffersfill, TaBIEs::bufferssize, TaBIEs::bufnum, CbUf::CanCommu, CbUf::dimension, inicbufs(), CbUf::numdum, CbUf::NumTerms, CbUf::Pointer, and CbUf::rhs.

Referenced by InsertArg(), StartVariables(), and TestMatch().

Here is the call graph for this function:

4.15.2.7 AddNtoL()

```
int AddNtoL (
             int n,
             WORD * array )
```

Adds an LHS with the given data to the current compiler buffer.

Parameters

n	The length of the data.
array	The data to be added.

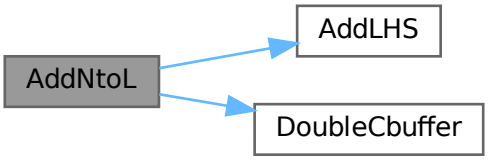
Returns

0 if succeeds.

Definition at line 284 of file comtool.c.

References AddLHS(), DoubleCbuffer(), CbUf::Pointer, and CbUf::Top.

Here is the call graph for this function:



4.15.2.8 AddNtoC()

```
int AddNtoC (
              int bufnum,
              int n,
              WORD * array,
              int par )
```

Adds the given data to the last LHS/RHS in a compiler buffer.

Parameters

bufnum	The ID number for the buffer where the data will be added.
n	The length of the data.
array	The data to be added.

Returns

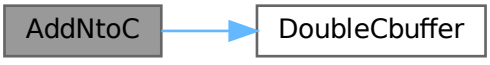
0 if succeeds.

Definition at line 313 of file comtool.c.

References DoubleCbuffer(), CbUf::Pointer, and CbUf::Top.

Referenced by InsertArg(), and StartVariables().

Here is the call graph for this function:



4.15.2.9 InsTree()

```
int InsTree (
            int bufnum,
            int h )
```

Definition at line 351 of file comtool.c.

4.15.2.10 FindTree()

```
int FindTree (
            int bufnum,
            WORD * subexpr )
```

Definition at line 531 of file comtool.c.

4.15.2.11 RedoTree()

```
void RedoTree (
            CBUF * C,
            int size )
```

Definition at line 567 of file comtool.c.

4.15.2.12 ClearTree()

```
void ClearTree (
            int i )
```

Definition at line 586 of file comtool.c.

4.15.2.13 IniFbuffer()

```
int IniFbuffer (
            WORD bufnum )
```

Initialize a factorization cache buffer. We set the size of the rhs and boomlijst buffers immediately to their final values.

Definition at line 612 of file comtool.c.

References tree::blnce, CbUf::boomlijst, CbUf::CanCommu, CbUf::dimension, tree::left, CbUf::numdum, CbUf::NumTerms, tree::parent, CbUf::rhs, tree::right, tree::usage, and tree::value.

4.15.2.14 numcommute()

```
LONG numcommute (
            WORD * terms,
            LONG * numterms )
```

Definition at line 657 of file comtool.c.

4.16 comtool.c

00330     #[ InsTree :
00331
00332     Routines for balanced tree searching and insertion.
00333     Compared to Knuth we have a parent link. This minimizes the
00334     number of compares. That is better for anything that is more
00335     complicated than just single numbers.
00336     There are no provisions for removing elements from the tree.
00337     The routines are:
00338     void RedoTree(size) Re-allocates the tree space. There will
00339                         be MaxTreeSize = size elements.
00340     void ClearTree()    Prunes the tree down to the root element.
00341     int InsTree(int,int)Searches for the requested element. If not found it
00342                         will allocate a new element, balance the tree if
00343                         necessary and return the called number.
00344                         If it was in the tree, it returns the tree 'value'.
00345

4.19.1 Detailed Description

Contains macros and function declarations.

Definition in file declare.h.

4.19.2 Macro Definition Documentation

4.19.2.1 MaX

```
#define MaX(
              x,
              y ) ((x) > (y) ?  (x):  (y))
```

Definition at line 40 of file declare.h.

4.19.2.2 MiN

```
#define MiN(
              x,
              y ) ((x) < (y) ?  (x):  (y))
```

Definition at line 41 of file declare.h.

4.19.2.3 ABS

```
#define ABS(
              x ) ( (x) < 0 ?  -(x):  (x) )
```

Definition at line 42 of file declare.h.

4.19.2.4 SGN

```
#define SGN(
              x ) ( (x) > 0 ?  1 :  (x) < 0 ?  -1 :  0 )
```

Definition at line 43 of file declare.h.

4.19.2.5 REDLENG

```
#define REDLENG(
              x ) ((((x)<0)?((x)+1):((x)-1))/2)
```

Definition at line 44 of file declare.h.

4.19.2.6 INCLENG

```
#define INCLENG(
              x ) (((x)<0)?(((x)*2)-1):(((x)*2)+1))
```

Definition at line 45 of file declare.h.

4.19.2.7 GETCOEF

```
#define GETCOEF(
              x,
              y ) x += *x;y = x[-1];x -= ABS(y);y=REDLENG(y)
```

Definition at line 46 of file declare.h.

4.19.2.8 GETSTOP

```
#define GETSTOP(
              x,
              y ) y=x+(*x)-1;y -= ABS(*y)-1
```

Definition at line 47 of file declare.h.

4.19.2.9 StuffAdd

```
#define StuffAdd(
              x,
              y ) (((x)<0?-1:1)*(y)+((y)<0?-1:1)*(x))
```

Definition at line 48 of file declare.h.

4.19.2.10 EXCHN

```
#define EXCHN(
              t1,
              t2,
              n ) { WORD a,i; for(i=0;i<n;i++){a=t1[i];t1[i]=t2[i];t2[i]=a;} }
```

Definition at line 50 of file declare.h.

4.19.2.11 EXCH

```
#define EXCH(
              x,
              y ) { WORD a = (x); (x) = (y); (y) = a; }
```

Definition at line 51 of file declare.h.

4.19.2.12 TOKENTOLINE

```
#define TOKENTOLINE(
              x,
              y )
```

Value:

```
if ( AC.OutputSpaces == NOSPACEFORMAT ) { \
TokenToLine((UBYTE *)(y)); } else { TokenToLine((UBYTE *)(x)); }
```

Definition at line 53 of file declare.h.

4.19.2.13 UngetFromStream

```
#define UngetFromStream(
              stream,
              c ) ((stream)->nextchar[(stream)->isnextchar++]=c)
```

Definition at line 56 of file declare.h.

4.19.2.14 AddLineFeed

```
#define AddLineFeed(
              s,
              n ) { (s)[(n)++] = LINEFEED; }
```

Definition at line 60 of file declare.h.

4.19.2.15 TryRecover

```
#define TryRecover(
              x ) Terminate(-1)
```

Definition at line 62 of file declare.h.

4.19.2.16 UngetChar

```
#define UngetChar(
              c ) { pushbackchar = c; }
```

Definition at line 63 of file declare.h.

4.19.2.17 ParseNumber

```
#define ParseNumber(
              x,
              s ) {(x)=0;while(*(s)>='0'&&*(s)<='9')(x)=10*(x)+*(s)++ -'0';}
```

Definition at line 64 of file declare.h.

4.19.2.18 ParseSign

```
#define ParseSign(
              sgn,
              s )
```

Value:

```
{(sgn)=0;while(*(s)=='-'||*(s)=='+'){\
if ( *(s)++ == '-' ) sgn ^= 1;}}
```

Definition at line 65 of file declare.h.

4.19.2.19 ParseSignedNumber

```
#define ParseSignedNumber(
              x,
              s )
```

Value:

```
{ int sgn; ParseSign(sgn,s)\
ParseNumber(x,s) if ( sgn ) x = -x; }
```

Definition at line 67 of file declare.h.

4.19.2.20 NCOPY

```
#define NCOPY(
              s,
              t,
              n ) { while ( (n)-- > 0 ) { *s++ = *t++; } }
```

Definition at line 71 of file declare.h.

4.19.2.21 NCOPYI

```
#define NCOPYI(
              s,
              t,
              n ) { while ( (n)-- > 0 ) { *s++ = *t++; } }
```

Definition at line 72 of file declare.h.

4.19.2.22 NCOPYB

```
#define NCOPYB(
              s,
              t,
              n ) { while ( (n)-- > 0 ) { *s++ = *t++; } }
```

Definition at line 73 of file declare.h.

4.19.2.23 NCOPYI32

```
#define NCOPYI32(
              s,
              t,
              n ) { while ( (n)-- > 0 ) { *s++ = *t++; } }
```

Definition at line 74 of file declare.h.

4.19.2.24 WCOPY

```
#define WCOPY(
              s,
              t,
              n ) { int nn=n; WORD *ss=(WORD *)s, *tt=(WORD *)t; while ( (nn)-- > 0 ) { *ss++ =
*tt++; } }
```

Definition at line 75 of file declare.h.

4.19.2.25 NeedNumber

```
#define NeedNumber(
              x,
              s,
              err )
```

Value:

```
       { int sgn = 1;                                  \
       while ( *s == ' ' || *s == '\t' || *s == '-' || *s == '+' ) {       \
           if ( *s == '-' ) {sgn = -sgn;} s++; }                            \
       if ( chartype[*s] != 1 ) goto err;                                   \
       ParseNumber(x,s)                                                     \
       if ( sgn < 0 ) {(x) = -(x);} while ( *s == ' ' || *s == '\t' ) s++;\
   }
```

Definition at line 85 of file declare.h.

4.19.2.26 SKIPBLANKS

```
#define SKIPBLANKS(
              s ) { while ( *(s) == ' ' || *(s) == '\t' ) (s)++; }
```

Definition at line 92 of file declare.h.

4.19.2.27 FLUSHCONSOLE

```
#define FLUSHCONSOLE if ( AP.InOutBuf > 0 ) CharOut(LINEFEED)
```

Definition at line 93 of file declare.h.

4.19.2.28 SKIPBRA1

```
#define SKIPBRA1(
              s )
```

Value:

```
{ int lev1=0; s++; while(*s) { if(*s=='['){lev1++;} \
else {if(*s==']'&&--lev1<0){break;}} s++;} }
```

Definition at line 95 of file declare.h.

4.19.2.29 SKIPBRA2

```
#define SKIPBRA2(
              s )
```

Value:

```
{ int lev2=0; s++; while(*s) { if(*s=='{'){lev2++;} \
else {if(*s=='}'&&--lev2<0){break;} \
else {if(*s=='['){SKIPBRA1(s)}}} s++;} }
```

Definition at line 97 of file declare.h.

4.19.2.30 SKIPBRA3

```
#define SKIPBRA3(
              s )
```

Value:

```
{ int lev3=0; s++; while(*s) { if(*s=='('){lev3++;} \
else {if(*s==')'&&--lev3<0){break;} \
else {if(*s=='{'){SKIPBRA2(s)} \
else {if(*s=='['){SKIPBRA1(s)}}}} s++;} }
```

Definition at line 100 of file declare.h.

4.19.2.31 SKIPBRA4

```
#define SKIPBRA4(
              s )
```

Value:

```
{ int lev4=0; s++; while(*s) { if(*s=='('){lev4++;} \
else {if(*s==')'&&--lev4<0){break;} \
else {if(*s=='['){SKIPBRA1(s)}}} s++;} }
```

Definition at line 104 of file declare.h.

4.19.2.32 SKIPBRA5

```
#define SKIPBRA5(
                s )
```

Value:

```
{ int lev5=0; s++; while(*s) { if(*s=='{'){lev5++;} \
else {if(*s=='}'&&--lev5<0){break;} \
else {if(*s=='('){SKIPBRA4(s)} \
else {if(*s=='['){SKIPBRA1(s)}}}} s++;} }
```

Definition at line 107 of file declare.h.

4.19.2.33 CYCLE1

```
#define CYCLE1(
                t,
                a,
                i ) {t iX=*a; WORD jX; for(jX=1;jX<i;jX++)a[jX-1]=a[jX]; a[i-1]=iX;}
```

Definition at line 115 of file declare.h.

4.19.2.34 AddToCB

```
#define AddToCB(
                c,
                wx )
```

Value:

```
if(c->Pointer>=c->Top) \
{DoubleCbuffer(c->cbuf,c->Pointer,21);} \
*(c->Pointer)++ = wx;
```

Definition at line 117 of file declare.h.

4.19.2.35 EXCHINOUT

```
#define EXCHINOUT
```

Value:

```
{ FILEHANDLE *ffFi = AR.outfile; \
AR.outfile = AR.infile; AR.infile = ffFi; }
```

Definition at line 121 of file declare.h.

4.19.2.36 BACKINOUT

```
#define BACKINOUT
```

Value:

```
{ FILEHANDLE *ffFi = AR.outfile; POSITION posi; \
AR.outfile = AR.infile; AR.infile = ffFi; \
SetEndScratch(AR.infile,&posi); }
```

Definition at line 123 of file declare.h.

4.19.2.37 CopyArg

```
#define CopyArg(
                to,
                from )
```

Value:

```
{ if ( *from > 0 ) { int ica = *from; NCOPY(to,from,ica) } \
else if ( *from <= -FUNCTION ) *to++ = *from++;  \
else { *to++ = *from++; *to++ = *from++; } }
```

Definition at line 127 of file declare.h.

4.19.2.38 FILLARG

```
#define FILLARG(
                w )
```

Definition at line 136 of file declare.h.

4.19.2.39 COPYARG

```
#define COPYARG(
                w,
                t )
```

Definition at line 137 of file declare.h.

4.19.2.40 ZEROARG

```
#define ZEROARG(
                w )
```

Definition at line 138 of file declare.h.

4.19.2.41 FILLFUN

```
#define FILLFUN(
                w )
```

Definition at line 145 of file declare.h.

4.19.2.42 COPYFUN

```
#define COPYFUN(
                w,
                t )
```

Definition at line 146 of file declare.h.

4.19.2.43 COPYFUN3

```
#define COPYFUN3(
                w,
                t )
```

Definition at line 153 of file declare.h.

4.19.2.44 FILLFUN3

```
#define FILLFUN3(
                w )
```

Definition at line 154 of file declare.h.

4.19.2.45 FILLSUB

```
#define FILLSUB(
                w )
```

Definition at line 161 of file declare.h.

4.19.2.46 COPYSUB

```
#define COPYSUB(
                w,
                ww )
```

Definition at line 162 of file declare.h.

4.19.2.47 FILLEXPR

```
#define FILLEXPR(
                w )
```

Definition at line 168 of file declare.h.

4.19.2.48 NEXTARG

```
#define NEXTARG(
                x ) if(*x>0) x += *x; else if(*x <= -FUNCTION)x++; else x += 2;
```

Definition at line 171 of file declare.h.

4.19.2.49 COPY1ARG

```
#define COPY1ARG(
                s1,
                t1 )
```

Value:

```
        { int ica; if ( (ica=*t1) > 0 ) { NCOPY(s1,t1,ica) } \
        else if(*t1<=-FUNCTION){*s1++=*t1++;} else{*s1++=*t1++;*s1++=*t1++;} }
```

Definition at line 172 of file declare.h.

4.19.2.50 ZeroFillRange

```
#define ZeroFillRange(
                w,
                begin,
                end )
```

Value:

```
    do { \
    int tmp_i; \
    for ( tmp_i = begin; tmp_i < end; tmp_i++ ) { (w)[tmp_i] = 0; } \
} while (0)
```

Fills a buffer by zero in the range [begin,end).

Parameters

w	The buffer.
begin	The index for the beginning of the range.
end	The index for the end of the range (exclusive).

Definition at line 182 of file declare.h.

4.19.2.51 TABLESIZE

```
#define TABLESIZE(

4.19.4.1 TELLFILE()

```
void TELLFILE (
            int handle,
            POSITION * position )  [extern]
```

Definition at line 1410 of file tools.c.

4.19.4.2 StartVariables()

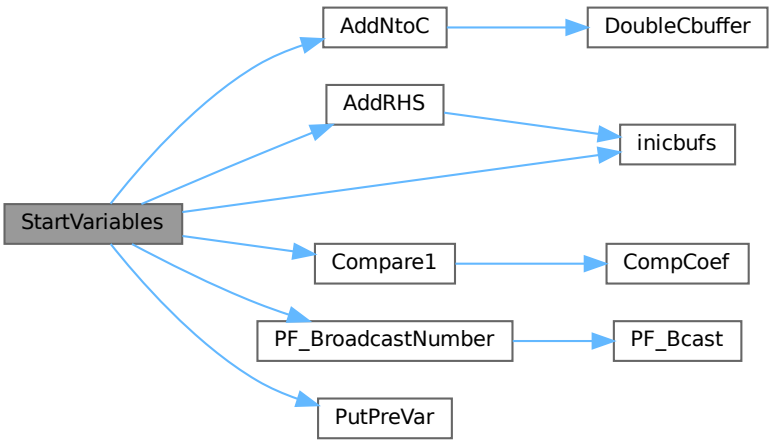
```
void StartVariables (
            void  )  [extern]
```

All functions (well, nearly all) are declared here.

Definition at line 952 of file startup.c.

References AddNtoC(), AddRHS(), Compare1(), inicbufs(), FuNcTiOn::name, PF_BroadcastNumber(), PutPreVar(), and FuNcTiOn::symmetric.

Here is the call graph for this function:



4.19.4.3 CodeToLine()

```
UBYTE * CodeToLine (
            WORD number,
            UBYTE * Out )  [extern]
```

Definition at line 640 of file sch.c.

4.19.4.4 AddArrayIndex()

```
UBYTE * AddArrayIndex (
            WORD num,
            UBYTE * out )  [extern]
```

Definition at line 678 of file sch.c.

4.19.4.5 FindInIndex()

```
INDEXENTRY * FindInIndex (
            WORD expr,
            FILEDATA * f,
            WORD par,
            WORD mode )  [extern]
```

Definition at line 2740 of file store.c.

4.19.4.6 NextFileIndex()

```
INDEXENTRY * NextFileIndex (
            POSITION * indexpos )  [extern]
```

Definition at line 2315 of file store.c.

4.19.4.7 PasteTerm()

```
WORD * PasteTerm (
            PHEAD WORD number,
            WORD * accum,
            WORD * position,
            WORD times,
            WORD divby )  [extern]
```

Puts the term at position in the accumulator accum at position 'number+1'. if times $>$ 0 the coefficient of this term is multiplied by times/divby.

Parameters

number	The number of term fragments in accum that should be skipped
accum	The accumulator of term fragments
position	A position in (typically) a compiler buffer from where a (piece of a) term comes.
times	Multiply the result by this
divby	Divide the result by this.

This routine is typically used when we have to replace a (sub)expression pointer by a power of a (sub)expression. This uses mostly a binomial expansion and the new term is the old term multiplied one by one by terms of the new expression. The factors times and divby keep track of the binomial coefficient. Once this is complete, the routine FiniTerm will make the contents of the accumulator into a proper term that still needs to be normalized.

Definition at line 3009 of file proces.c.

Referenced by Generator().

4.19.4.8 StrCopy()

```
UBYTE * StrCopy (
            UBYTE * from,
            UBYTE * to )  [extern]
```

Definition at line 49 of file sch.c.

4.19.4.9 WrtPower()

```
UBYTE * WrtPower (
            UBYTE * Out,
            WORD Power )  [extern]
```

Definition at line 720 of file sch.c.

4.19.4.10 AccumGCD()

```
int AccumGCD (
            PHEAD UWORD * a,
            WORD * na,
            UWORD * b,
            WORD nb )  [extern]
```

Definition at line 656 of file reken.c.

4.19.4.11 AddArgs()

```
void AddArgs (
            PHEAD WORD * s1,
            WORD * s2,
            WORD * m )  [extern]
```

Adds the arguments of two occurrences of the PolyFun.

Parameters

s1	Pointer to the first occurrence.
s2	Pointer to the second occurrence.
m	Pointer to where the answer should be.

Definition at line 2098 of file sort.c.

Referenced by AddPoly(), and MergePatches().

4.19.4.12 AddCoef()

```
int AddCoef (
            PHEAD WORD ** ps1,
            WORD ** ps2 )  [extern]
```

Adds the coefficients of the terms ∗ps1 and ∗ps2. The problem comes when there is not enough space for a new longer coefficient. First a local solution is tried. If this is not successful we need to move terms around. The possibility of a garbage collection should not be ignored, as avoiding this costs very much extra space which is nearly wasted otherwise.

If the return value is zero the terms cancelled.

The resulting term is left in ∗ps1.

Definition at line 1795 of file sort.c.

4.19.4.15 AddPoly()

```
int AddPoly (
            PHEAD WORD ** ps1,
            WORD ** ps2 )  [extern]
```

Routine should be called when S->PolyWise != 0. It points then to the position of AR.PolyFun in both terms.

We add the contents of the arguments of the two polynomials. Special attention has to be given to special arguments. We have to reserve a space equal to the size of one term + the size of the argument of the other. The addition has to be done in this routine because not all objects are reentrant.

Newer addition (12-nov-2007). The PolyFun can have two arguments. In that case S->PolyFlag is 2 and we have to call the routine for adding rational polynomials. We have to be rather careful what happens with: The location of the output The order of the terms in the arguments At first we allow only univariate polynomials in the PolyFun. This restriction will be lifted a.s.a.p.

Parameters

ps1	A pointer to the position of the first term
ps2	A pointer to the position of the second term

Returns

If zero the terms cancel. Otherwise the new term is in *ps1.

4.19.4.32 CompGroup()

```
int CompGroup (
              PHEAD WORD,
              WORD ** args,
              WORD * a1,
              WORD * a2,
              WORD num )  [extern]
```

Definition at line 373 of file function.c.

4.19.4.33 Compare1()

```
WORD Compare1 (
              PHEAD WORD * term1,
              WORD * term2,
              WORD level )  [extern]
```

Compares two terms. The answer is: 0 equal (with exception of the coefficient if level == 0.) >0 term1 comes first. <0 term2 comes first. Some special precautions may be needed to keep the CompCoef routine from generating overflows, although this is very unlikely in subterms. This routine should not return an error condition.

Originally this routine was called Compare. With the treatment of special polynomials with terms that contain only symbols and the need for extreme speed for the polynomial routines we made a special compare routine and now we store the address of the current compare routine in AR.CompareRoutine and have a macro Compare which makes all existing code work properly and we can just replace the routine on a thread by thread basis (each thread has its own AR struct).

Parameters

term1	First input term
term2	Second input term
level	The sorting level (may influence on the result)

Returns

0 equal (with exception of the coefficient if level == 0.) >0 term1 comes first. <0 term2 comes first.

When there are floating point numbers active (float_ = FLOATFUN) the presence of one or more float_ functions is returned in AT.SortFloatMode: 0: no float_ 1: float_ in term1 only 2: float_ in term2 only 3: float_ in both terms

Definition at line 2393 of file sort.c.

Definition at line 1002 of file reshuf.c.

4.19.4.39 Deferred()

```
int Deferred (
            PHEAD WORD * term,
            WORD level )  [extern]
```

Picks up the deferred brackets. These are the bracket contents of which we postpone the reading when we use the 'Keep Brackets' statement. These contents are multiplying the terms just before they are sent to the sorting system. Special attention goes to having it thread-safe We have to lock positioning the file and reading it in a thread specific buffer.

Parameters

term	The term that must be multiplied by the contents of the current bracket
level	The compiler level. This is needed because after multiplying term by term we call Generator again.

              WORD * aa,
              WORD level,
              WORD * freeze )  [extern]
```

Routine gets one power of an expression in the scratch system. If there are more powers needed there will be a recursion.

No attempt is made to use binomials because we have no information about commuting properties.

There is a searching for the contents of brackets if needed. This searching may be rather slow because of the single links.

Parameters

term	is the term we are adding to.
power	is the power of the expression that we need.
nexp	is the number of the expression.
accum	is the accumulator of terms. It accepts the termfragments that are made into a proper term in FiniTerm
aa	points to the start of the entire accumulator. In ∗aa we store the number of term fragments that are in the accumulator.
level	is the current depth in the tree of statements. It is needed to continue to the next operation/substitution with each generated term
freeze	is the pointer to the bracket information that should be matched.

            PHEAD WORD * t )  [extern]
```

Definition at line 4324 of file normal.c.

4.19.4.82 EndSort()

```
LONG EndSort (
            PHEAD WORD * buffer,
            int par )  [extern]
```

Finishes a sort. At AR.sLevel == 0 the output is to the regular output stream. When AR.sLevel $>$ 0, the parameter par determines the actual output. The AR.sLevel will be popped. All ongoing stages are finished and if the sortfile is open it is closed. The statistics are printed when AR.sLevel == 0 par == 0 Output to the buffer. par == 1 Sort for function arguments. The output will be copied into the buffer. It is assumed that this is in the WorkSpace. par == 2 Sort for $-variable. We return the address of the buffer that contains the output in buffer (treated like WORD $**$). We first catch the output in a file (unless we can intercept things after the small buffer has been sorted) Then we read from the file into a buffer. Only when par == 0 data compression can be attempted at AT.SS==AT.S0.

Parameters

buffer	buffer for output when needed
par	See above

Returns

If negative: error. If positive: number of words in output.

            WORD * termout,
            WORD number,
            WORD tepos )  [extern]
```

Concatenates the contents of the accumulator into a single legal term, which replaces the subexpression pointer

Parameters

term	the input term with the (sub)expression subterm
accum	the accumulator with the term fragments
termout	the location where the output should be written
number	the number of term fragments in the accumulator
tepos	the position of the subterm in term to be replaced

Definition at line 3076 of file proces.c.

Referenced by DoOnePow(), and Generator().

4.19.4.100 FlushOut()

```
int FlushOut (
              POSITION * position,
              FILEHANDLE * fi,
              int compr )  [extern]
```

Completes output to an output file and writes the trailing zero.

Parameters

position	The position in the file after writing
fi	The file (or its cache)
compr	Indicates whether there should be compression with gzip.

Returns

Regular conventions (OK -> 0).

Definition at line 1581 of file sort.c.

```
void GarbHand (
            void  )  [extern]
```

Garbage collection that takes place when the small extension is full and we need to place more terms there. When this is the case there are many holes in the small buffer and the whole can be compactified. The major complication is the buffer for SplitMerge. There are to options for temporary memory: 1: find some buffer that has enough space (maybe in the large buffer). 2: allocate a buffer. Give it back afterwards of course. If the small extension is properly dimensioned this routine should be called very rarely. Most of the time it will be called when the polyfun or polyratfun is active.

4.19.4.106 Generator()

```
int Generator (
             PHEAD WORD * term,
             WORD level )  [extern]
```

The heart of the program. Here the expansion tree is set up in one giant recursion

Parameters

term	the input term. may be overwritten
level	the level in the compiler buffer (number of statement)

Returns

Normal conventions (OK = 0).

The routine looks first whether there are unsubstituted (sub)expressions. If so, one of them gets inserted term by term and the new term is used in a renewed call to Generator. If there are no (sub)expressions, the term is normalized, the compiler level is raised (next statement) and the program looks what type of statement this is. If this is a special statement it is either treated on the spot or the appropriate routine is called. If it is a substitution, the pattern matcher is called (TestMatch) which tells whether there was a match. If so we need to call TestSub again to test for (sub)expressions. If we run out of levels, the term receives a final treatment for modulus calculus and/or brackets and is then sent off to the sorting routines.

Definition at line 461 of file ratio.c.

4.19.4.116 InFunction()

```
int InFunction (
            PHEAD WORD * term,
            WORD * termout )  [extern]
```

Makes the replacement of the subexpression with the number 'replac' in a function argument. Additional information is passed in some of the AR, AN, AT variables.

Parameters

term	The input term
termout	The output term

Returns

0: everything is fine, Negative: fatal, Positive: error.

Special attention should be given to nested functions!

Definition at line 2180 of file proces.c.

References Compare1(), CompareSymbols(), EndSort(), Generator(), LowerSortLevel(), NewSort(), StoreTerm(), and SymbolNormalize().

Referenced by Generator().

4.19.4.119 InsertTerm()

```
int InsertTerm (
              PHEAD WORD * term,
              WORD replac,
              WORD extractbuff,
              WORD * position,
              WORD * termout,
              WORD tepos )  [extern]
```

Puts the terms 'term' and 'position' together into a single legal term in termout. replac is the number of the subexpression that should be replaced. It must be a positive term. When action is needed in the argument of a function all terms in that argument are dealt with recursively. The subexpression is sorted. Only one subexpression is done at a time this way.

Parameters

term	the input term
replac	number of the subexpression pointer to replace
extractbuff	number of the compiler buffer replac refers to
position	position from where to take the term in the compiler buffer
termout	the output term
tepos	offset in term where the subexpression is.

Returns

Normal conventions (OK = 0).

Definition at line 826 of file function.c.

4.19.4.132 MergePatches()

```
int MergePatches (
            WORD par )  [extern]
```

The general merge routine. Can be used for the large buffer and the file merging. The array S->Patches tells where the patches start S->pStop tells where they end (has to be computed first). The end of a 'line to be merged' is indicated by a zero. If the end is reached without running into a zero or a term runs over the boundary of a patch it is a file merging operation and a new piece from the file is read in.

Parameters

par	If par == 0 the sort is for file -> outputfile. If par == 1 the sort is for large buffer -> sortfile. If par == 2 the sort is for large buffer -> outputfile.

            RENUMBER renumber,
            WORD * freeze,
            WORD nexpr )  [extern]
```

Gets a term from stored expression expr and puts it in the accumulator at position number. It returns the length of the term that came from file.

Parameters

number	number of partial terms to skip in accum
accum	the accumulator
position	file position from where to get the stored term
accfill	returns tail position in accum
renumber	the renumber struct for the variables in the stored expression
freeze	information about if we need only the contents of a bracket
nexpr	the number of the stored expression

Returns

Normal conventions (OK = 0).

Definition at line 2885 of file proces.c.

Referenced by Generator().

4.19.4.151 Permute()

```
int Permute (
              PERM * perm,
              WORD first )  [extern]
```

Definition at line 444 of file symmetr.c.

4.19.4.152 PermuteP()

```
int PermuteP (
              PERMP * perm,
              WORD first )  [extern]
```

Definition at line 478 of file symmetr.c.

4.19.4.153 PolyFunMul()

```
int PolyFunMul (
              PHEAD WORD * term )  [extern]
```

Multiplies the arguments of multiple occurrences of the polyfun. In this routine we do the original PolyFun with one argument only. The PolyRatFun (PolyFunType = 2) is done in a dedicated routine in the file polywrap.cc The new result is written over the old result.

Parameters

term	It contains the input term and later the output.

Returns

Normal conventions (OK = 0).

Definition at line 5394 of file proces.c.

References EndSort(), LowerSortLevel(), NewSort(), poly_ratfun_normalize(), and StoreTerm().

Referenced by Generator().

4.19.4.154 PopVariables()

```
int PopVariables (
            void  )  [extern]
```

Definition at line 211 of file execute.c.

4.19.4.155 PrepPoly()

```
int PrepPoly (
            PHEAD WORD * term,
            WORD par )  [extern]
```

Routine checks whether the count of function AR.PolyFun is zero or one. If it is one and it has one scalarlike argument the coefficient of the term is pulled inside the argument. If the count is zero a new function is made with the coefficient as its only argument. The function should be placed at its proper position.

When this function is active it places the PolyFun as last object before the coefficient. This is needed because otherwise the compress algorithm has problems in MergePatches.

The bracket routine should also place the PolyFun at a comparable spot. The compression should then stop at the PolyFun. It doesn't really have to stop when writing the final result but this may be too complicated.

The parameter par tells whether we are at groundlevel or inside a function or dollar variable.

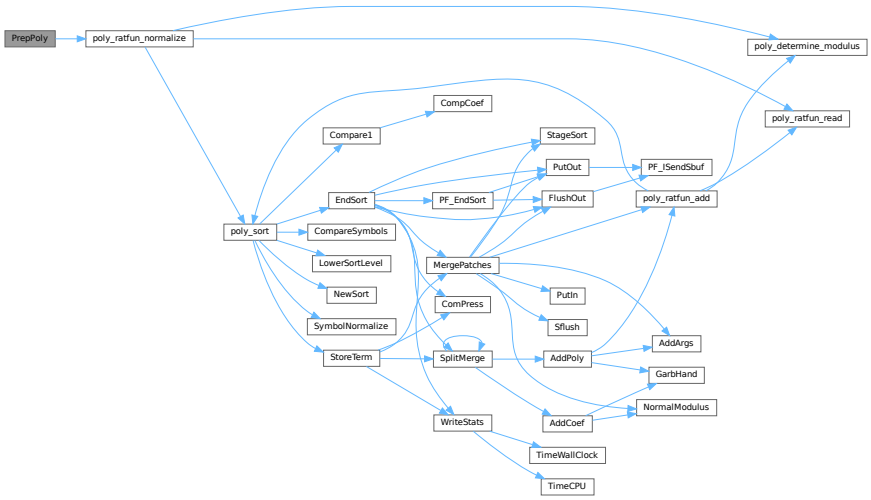
References poly_ratfun_normalize().

Referenced by Generator().

Here is the call graph for this function:



4.19.4.156 Processor()

```
int Processor (
            void  )  [extern]
```

This is the central processor. It accepts a stream of Expressions which is accessed by calls to GetTerm. The expressions reside either in AR.infile or AR.hidefile The definitions of an expression are seen as an id-statement, so the primary Expressions should be written to the system of scratch files as single terms with an expression pointer. Each expression is terminated with a zero and the whole is terminated by two zeroes.

The routine DoExecute should determine whether results are to be printed, should revert the scratch I/O directions etc. In principle it is DoExecute that calls Processor.

Returns

if everything OK: 0. Otherwise error. The preprocessor may continue with compilation though. Really fatal errors should return on the spot by calling Terminate.

Definition at line 64 of file proces.c.

            PHEAD WORD * termin )  [extern]
```

Definition at line 1214 of file execute.c.

4.19.4.165 PutIn()

```
LONG PutIn (
            FILEHANDLE * file,
            POSITION * position,
            WORD * buffer,
            WORD ** take,
            int npat )  [extern]
```

Reads a new patch from position in file handle. It is put at buffer, anything after take is moved forward. This would be part of a term that hasn't been used yet. Because of this there should be some space before the start of the buffer

Parameters

file	The file system from which to read
position	The position from which to read
buffer	The buffer into which to read
take	The unused tail should be moved before the buffer
npat	The number of the patch. Is needed if the information was compressed with gzip, because each patch has its own independent gzip encoding.

Definition at line 1065 of file sort.c.

References FiLe::handle.

Referenced by MergePatches().

4.19.4.166 PutInStore()

```
int PutInStore (
            INDEXENTRY * ind,
            WORD num )  [extern]
```

Definition at line 899 of file store.c.

4.19.4.167 PutOut()

```
WORD PutOut (
            PHEAD WORD * term,
            POSITION * position,
            FILEHANDLE * fi,
            WORD ncomp )  [extern]
```

Routine writes one term to file handle at position. It returns the new value of the position.

NOTE: For 'final output' we may have to index the brackets. See the struct BRACKETINDEX. We should maintain: 1: a list with brackets array with the brackets 2: a list of objects of type BRACKETINDEX. It contains array with either pointers or offsets to the list of brackets. starting positions in the file. The index may be tied to a maximum size. In that case we may have to prune the list occasionally.

Parameters

term	The term to be written
position	The position in the file. Afterwards it is updated
fi	The file (or its cache) to which should be written
ncomp	Information about what type of compression should be used

Definition at line 1217 of file sort.c.

4.19.6.25 SplitMerge()

```
LONG SplitMerge (
            PHEAD WORD ** Pointer,
            LONG number )  [extern]
```

Algorithm by J.A.M.Vermaseren (31-7-1988)

Note that AN.SplitScratch and AN.InScratch are used also in GarbHand

Merge sort in memory. The input is an array of pointers. Sorting is done recursively by dividing the array in two equal parts and calling SplitMerge for each. When the parts are small enough we can do the compare and take the appropriate action. An addition is that we look for 'runs'. Sequences that are already ordered. This happens a lot when there is very little action in a module. This made FORM faster by a few percent.

Parameters

Pointer	The array of pointers to the terms to be sorted.
number	The number of pointers in Pointer.

The terms are supposed to be sitting in the small buffer and there is supposed to be an extension to this buffer for when there are two terms that should be added and the result takes more space than each of the original terms. The notation guarantees that the result never needs more space than the sum of the spaces of the original terms.

Definition at line 3125 of file sort.c.

```
int TestMatch (
            PHEAD WORD * term,
            WORD * level )  [extern]
```

This routine governs the pattern matching. If it decides that a substitution should be made, this can be either the insertion of a right hand side (C->rhs) or the automatic generation of terms as a result of an operation (like trace). The object to be replaced is removed from term and a subexpression pointer is inserted. If the substitution is made more than once there can be more subexpression pointers. Its number is positive as it corresponds to the level at which the C->rhs can be found in the compiler output. The subexpression pointer contains the wildcard substitution information. The power is found in *AT.TMout. For operations the subexpression pointer is negative and corresponds to an address in the array AT.TMout. In this array are then the instructions for the routine to be called and its number in the array 'Operations' The format is here: length,functionnumber,length-2 parameters

There is a certain complexity wrt repeat levels. Another complication is the poking of the wildcard values in the subexpression prototype in the compiler buffer. This was how things were done in the past with sequential FORM, but with the advent of TFORM this cannot be maintained. Now, for TFORM we make a copy of it. 7-may-2008 (JV): We cannot yet guarantee that this has been done 100% correctly. There are errors that occur in TFORM only and that may indicate problems.

            UBYTE * value,
            UBYTE * args,
            int mode )  [extern]
```

Inserts/Updates a preprocessor variable in the name administration.

Parameters

name	Character string with the variable name.
value	Character string with a possible value. Special case: if this argument is zero, then we have no value. Note: This is different from having an empty argument! This should only occur when the name starts with a ?
args	Character string with possible arguments.
mode	=0: always create a new name entry, =1: try to do a redefinition if possible.

Returns

Index of used entry in name list.

            int level )  [extern]
```

Skips from `s` to the end of a declaration field (e.g., `x`, `1+2*[x+a]`, or `f({x,[x+a]},1)`).

Parameters

in	*s*	Pointer to a null-terminated input buffer.
in	*level*	Number of parentheses that still have to be closed.

Returns

Pointer to the character after the field, which is either a comma at level 0 or the null terminator.

```
int TheDefine (
            UBYTE * s,
            int mode )  [extern]
```

Preprocessor assignment. Possible arguments and values are treated and the new preprocessor variable is put into the name administration.

Parameters

s	Pointer to the character string following the preprocessor command.
mode	Bitmask. 0-bit clear: always create a new name entry, 0-bit set: try to redefine an existing name, 1-bit set: ignore preprocessor if/switch status.

Returns

zero: no errors, negative number: errors.

Definition at line 2039 of file pre.c.

4.19.6.281 EndOfToken()

```
UBYTE * EndOfToken (
            UBYTE * s )  [extern]
```

Skips over alphanumeric characters to find the end of the token.

Note

This function does not handle formal names (e.g., `[x+a]`). To handle them, use `SkipAName` instead.

Parameters

in	*s*	Pointer to a null-terminated input buffer.

Returns

Pointer to the first non-alphanumeric character (i.e., the character immediately after the token), or the null terminator if the token reaches the end of the string.

Definition at line 1934 of file tools.c.

4.19.6.282 SetSpecialMode()

4.19.6.292 ToToken()

```
UBYTE * ToToken (
            UBYTE * s )  [extern]
```

Skips over non-alphanumeric characters to find the start of a token.

Note

This function does not handle formal names (e.g., `[x+a]`). To handle them, consider simply skipping whitespace, e.g., by using `SkipSpaces`.

Parameters

in	*s*	Pointer to a null-terminated input buffer.

Returns

Pointer to the first alphanumeric character (i.e., the start of the token), or the null terminator if none is found.

Definition at line 1957 of file tools.c.

4.19.6.306 ExpandTripleDots()

```
int ExpandTripleDots (
            int par )  [extern]
```

Definition at line 1610 of file pre.c.

4.19.6.307 ComPress()

```
LONG ComPress (
            WORD ** ss,
            LONG * n )  [extern]
```

Gets a list of pointers to terms and compresses the terms. In n it collects the number of terms and the return value of the function is the space that is occupied.

We have to pay some special attention to the compression of terms with a PolyFun. This PolyFun should occur only straight before the coefficient, so we can use the same trick as for the coefficient to sabotage compression of this object (Replace in the history the function pointer by zero. This is safe, because terms that would be identical otherwise would have been added).

Parameters

ss	Array of pointers to terms to be compressed.
n	Number of pointers in ss.

Returns

Total number of words needed for the compressed result.

Definition at line 2959 of file sort.c.

Referenced by EndSort(), and StoreTerm().

4.19.6.308 StageSort()

```
void StageSort (
            FILEHANDLE * fout )  [extern]
```

Prepares a stage 4 or higher sort. Stage 4 sorts occur when the sort file contains more patches than can be merged in one pass.

Definition at line 4437 of file sort.c.

References FiLe::handle.

Referenced by EndSort(), and MergePatches().

4.19.6.309 M_free()

Definition at line 815 of file tools.c.

4.19.6.318 DoubleCbuffer()

```
WORD * DoubleCbuffer (
            int num,
            WORD * w,
            int par )  [extern]
```

Doubles a compiler buffer.

Parameters

num	The ID number for the buffer to be doubled.
w	The pointer to the end (exclusive) of the current buffer. The contents in the range of [cbuf[num].Buffer,w) will be kept.

Definition at line 143 of file comtool.c.

References CbUf::Buffer, CbUf::BufferSize, CbUf::lhs, CbUf::Pointer, CbUf::rhs, and CbUf::Top.

Referenced by AddNtoC(), and AddNtoL().

4.19.6.319 AddLHS()

```
WORD * AddLHS (
            int num )  [extern]
```

Adds an LHS to a compiler buffer and returns the pointer to a buffer for the new LHS.

Parameters

num	The ID number for the buffer to get another LHS.

Definition at line 184 of file comtool.c.

References CbUf::lhs, and CbUf::Pointer.

Referenced by AddNtoL().

4.19.6.320 AddRHS()

```
WORD * AddRHS (
            int num,
            int type )  [extern]
```

Adds an RHS to a compiler buffer and returns the pointer to a buffer for the new RHS.

Parameters

num	The ID number for the buffer to get another RHS.
type	If 0, the subexpression tree will be reallocated.

Definition at line 210 of file comtool.c.

References TaBlEs::buffers, TaBlEs::buffersfill, TaBlEs::bufferssize, TaBlEs::bufnum, CbUf::CanCommu, CbUf::dimension, inicbufs(), CbUf::numdum, CbUf::NumTerms, CbUf::Pointer, and CbUf::rhs.

Referenced by InsertArg(), StartVariables(), and TestMatch().

Here is the call graph for this function:

4.19.6.321 AddNtoL()

```
int AddNtoL (
            int n,
            WORD * array )  [extern]
```

Adds an LHS with the given data to the current compiler buffer.

Parameters

n	The length of the data.
array	The data to be added.

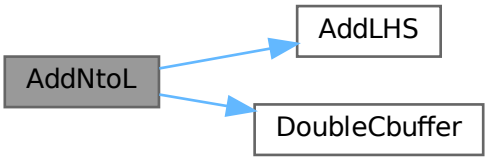
Returns

0 if succeeds.

Definition at line 284 of file comtool.c.

References AddLHS(), DoubleCbuffer(), CbUf::Pointer, and CbUf::Top.

Here is the call graph for this function:



4.19.6.322 AddNtoC()

```
int AddNtoC (
              int bufnum,
              int n,
              WORD * array,
              int par )  [extern]
```

Adds the given data to the last LHS/RHS in a compiler buffer.

Parameters

bufnum	The ID number for the buffer where the data will be added.
n	The length of the data.
array	The data to be added.

Returns

0 if succeeds.

Definition at line 313 of file comtool.c.

References DoubleCbuffer(), CbUf::Pointer, and CbUf::Top.

Referenced by InsertArg(), and StartVariables().

            UBYTE * string2 )  [extern]
```

Definition at line 1734 of file compcomm.c.

4.19.6.330 DoSymmetrize()

```
int DoSymmetrize (
            UBYTE * s,
            int par )  [extern]
```

Definition at line 2245 of file compcomm.c.

4.19.6.331 DoArgument()

```
int DoArgument (
            UBYTE * s,
            int par )  [extern]
```

Definition at line 1873 of file compcomm.c.

4.19.6.332 ArgFactorize()

```
int ArgFactorize (
            PHEAD WORD * argin,
            WORD * argout )  [extern]
```

Definition at line 2070 of file argument.c.

4.19.6.333 TakeArgContent()

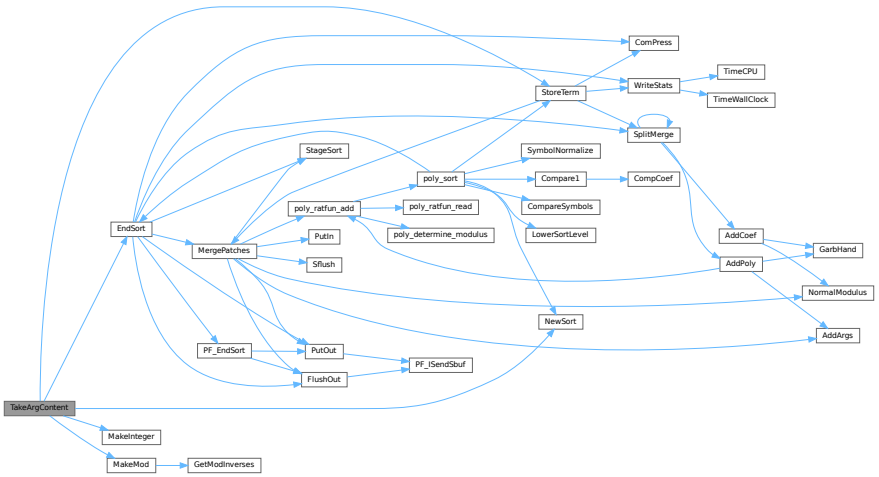
```
WORD * TakeArgContent (
            PHEAD WORD * argin,
            WORD * argout )  [extern]
```

Implements part of the old ExecArg in which we take common factors from arguments with more than one term. The common pieces are put in argout as a sequence of arguments. The part with the multiple terms that are now relative prime is put in argfree which is allocated via TermMalloc and is given as the return value. The difference with the old code is that negative powers are always removed. Hence it is as in MakeInteger in which only numerators will be left: now only zero or positive powers will be remaining.

Definition at line 2778 of file argument.c.

References EndSort(), MakeInteger(), MakeMod(), NewSort(), and StoreTerm().

Here is the call graph for this function:



4.19.6.334 MakeInteger()

```
WORD * MakeInteger (
            PHEAD WORD * argin,
            WORD * argout,
            WORD * argfree )  [extern]
```

For normalizing everything to integers we have to determine for all elements of this argument the LCM of the denominators and the GCD of the numerators. The input argument is in argin. The number that comes out should go to argout. The new pointer in the argout buffer is the return value. The normalized argument is in argfree.

Definition at line 3328 of file argument.c.

Referenced by TakeArgContent().

4.19.6.335 MakeMod()

```
WORD * MakeMod (
            PHEAD WORD * argin,
            WORD * argout,
            WORD * argfree )  [extern]
```

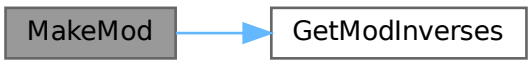
Similar to MakeInteger but now with modulus arithmetic using only a one WORD 'prime'. We make the coefficient of the first term in the argument equal to one. Already the coefficients are taken modulus AN.cmod and AN.ncmod == 1

Definition at line 3499 of file argument.c.

References GetModInverses().

Referenced by TakeArgContent().

Here is the call graph for this function:



4.19.6.336 FindArg()

```
WORD FindArg (
            PHEAD WORD * a )  [extern]
```

Looks the argument up in the (workers) table. If it is found the number in the table is returned (plus one to make it positive). If it is not found we look in the compiler provided table. If it is found - the number in the table is returned (minus one to make it negative). If in neither table we return zero.

Definition at line 2525 of file argument.c.

4.19.6.337 InsertArg()

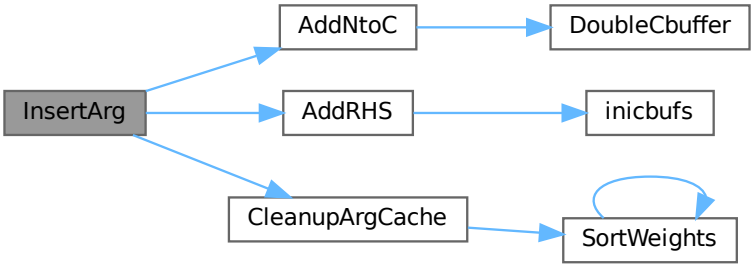
```
int InsertArg (
            PHEAD WORD * argin,
            WORD * argout,
            int par )  [extern]
```

Inserts the argument into the (workers) table. If the table is too full we eliminate half of it. The eliminated elements are the ones that have not been used most recently, weighted by their total use and age(?). If par == 0 it inserts in the regular factorization cache If par == 1 it inserts in the cache defined with the FactorCache statement

Definition at line 2549 of file argument.c.

References AddNtoC(), AddRHS(), and CleanupArgCache().

Here is the call graph for this function:



4.19.6.338 CleanupArgCache()

```
int CleanupArgCache (
            PHEAD WORD bufnum )  [extern]
```

Cleans up the argument factorization cache. We throw half the elements. For a weight of what we want to keep we use the product of usage and the number in the buffer.

Definition at line 2584 of file argument.c.

References CbUf::boomlijst, CbUf::Buffer, CbUf::Pointer, CbUf::rhs, SortWeights(), and tree::usage.

4.19.6.524 SkipAName()

```
UBYTE * SkipAName (
            UBYTE * s )  [extern]
```

Skips a name and gives a pointer to the character after the name. If there is not a proper name, it emits a compiler message and then returns a null pointer. This function supports formal names (e.g., `[x+a]`) and $-variables in addition to ordinary identifiers.

Note

The brackets are assumed to be matched already.

Parameters

in	*s*	Pointer to a null-terminated input string that starts with a name.

Returns

Pointer to the character after the name, or a null pointer if the name is invalid.

4.19.6.573 AddPotModdollar()

```
void AddPotModdollar (
            WORD numdollar )  [extern]
```

Adds a $-variable specified by *numdollar* to the list of potentially modified $-variables unless it has already been included in the list.

Parameters

numdollar	The index of the $-variable to be added.

Definition at line 3944 of file dollar.c.

4.19.6.574 Optimize()

```
int Optimize (
              WORD exprnr,
              int do_print )  [extern]
```

Optimization of expression

4.19.7 Description

This method takes an input expression and generates optimized code to calculate its value. The following methods are called to do so:

(1) get_expression : to read to expression

(2) get_brackets : find brackets for simultaneous optimization

(3) occurrence_order or find_Horner_MCTS : to determine (the) Horner scheme(s) to use; this depends on AO.↩ optimize.horner

(4) optimize_expression_given_Horner : to do the optimizations for each Horner scheme; this method does either CSE or greedy optimizations dependings on AO.optimize.method

(5) generate_output : to format the output in Form notation and store it in a buffer

(6a) optimize_print_code : to print the expression (for "Print") or (6b) generate_expression : to modify the expression (for "#Optimize")

On ParFORM, all the processes must call this function at the same time. Then

(1) Because only the master can access to the expression to be optimized, the master broadcast the expression to all the slaves after reading the expression (PF_get_expression).

(2) get_brackets reads optimize_expr as the input and it works also on the slaves. We leave it although the bracket information is not needed on the slaves (used in (5) on the master).

(3) and (4) find_Horner_MCTS and optimize_expression_given_Horner are parallelized.

(5), (6a) and (6b) are needed only on the master.

Definition at line 4641 of file optimize.cc.

4.19.7.1 ClearOptimize()

```
int ClearOptimize (
            void  )  [extern]
```

Optimization of expression

4.19.8 Description

Clears the buffers that were used for optimization output. Clears the expression from the buffers (marks it to be dropped). Note: we need to use the expression by its name, because numbers may change if we drop other expressions between when we do the optimizations and clear the results (in execute.c). Also this is not 100% safe, because we could overwrite the optimized expression. But that can be done only in a Local or Global statement and hence we only have to test there that we might have to call ClearOptimize first. (in file comexpr.c)

Definition at line 4978 of file optimize.cc.

```
WORD EvalDoLoopArg (
            PHEAD WORD * arg,
            WORD par )  [extern]
```

Evaluates one argument of a do loop. Such an argument is constructed from SNUMBERs DOLLAREXPRESSIONs and possibly DOLLAREXPR2s which indicate factors of the preceding dollar. Hence we have SNUMBER,num DOLLAREXPRESSION,numdollar DOLLAREXPRESSION,numdollar,DOLLAREXPR2,numfactor DOLLAREXPRESSION,numdollar,DOLLAREXPR2,numfactor,DOLLAREXPR2,numfactor etc. Because we have a do-loop at every stage we should have a number. The notation in DOLLAREXPR2 is that >= 0 is number of yet another dollar and < 0 is -n-1 with n the array element or zero. The return value is the (short) number. The routine works its way through the list in a recursive manner.

int GetFirstTerm (
            WORD * term,
            int num,
            int pre )  [extern]
```

Gets the first term of an expression. Routine should be thread safe.

Parameters

out	*term*	Pointer to the buffer where the term should be written.
in	*num*	The expression number from which to get the term.
in	*pre*	Denotes a pre-processor call (1) or not (0). Used to determine the correct source file for the expression.

Returns

First WORD of term, a negative value denotes an error.

Definition at line 2329 of file tables.c.

4.19.8.118 SymbolNormalize()

```
int SymbolNormalize (
            WORD * term )  [extern]
```

Routine normalizes terms that contain only symbols. Regular minimum and maximum properties are ignored.

We check whether there are negative powers in the output. This is not allowed.

Definition at line 5210 of file normal.c.

Referenced by InFunction(), and poly_sort().

4.19.8.119 TestFunFlag()

```
int TestFunFlag (
            PHEAD WORD * tfun )  [extern]
```

Definition at line 5311 of file normal.c.

4.19.8.120 CompareSymbols()

```
WORD CompareSymbols (
            PHEAD WORD * term1,
            WORD * term2,
            WORD par )  [extern]
```

Compares the terms, based on the value of AN.polysortflag. If term1 $<$ term2 the return value is -1 If term1 $>$ term2 the return value is 1 If term1 = term2 the return value is 0 The coefficients may differ. The terms contain only a single subterm of type SYMBOL. If AN.polysortflag = 0 it is a 'regular' compare. If AN.polysortflag = 1 the sum of the powers is more important par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in sort.c

Definition at line 2856 of file sort.c.

Referenced by InFunction(), and poly_sort().

4.19.8.121 CompareHSymbols()

```
WORD CompareHSymbols (
            PHEAD WORD * term1,
            WORD * term2,
            WORD par )  [extern]
```

Compares terms that can have only SYMBOL and HAAKJE subterms. If term1 $<$ term2 the return value is -1 If term1 $>$ term2 the return value is 1 If term1 = term2 the return value is 0 par is a dummy parameter to make the parameter field identical to that of Compare1 which is the regular compare routine in sort.c

Definition at line 2906 of file sort.c.

4.19.8.122 NextPrime()

```
WORD NextPrime (
            PHEAD WORD num )  [extern]
```

Gives the next prime number in the list of prime numbers.

If the list isn't long enough we expand it. For ease in ParForm and because these lists shouldn't be very big we let each worker keep its own list.

The list is cut off at MAXPOWER, because we don't want to get into trouble that the power of a variable gets larger than the prime number.

Definition at line 3685 of file reken.c.

4.19.8.128 TreatPolyRatFun()

```
int TreatPolyRatFun (
            PHEAD WORD * prf )  [extern]
```

Definition at line 5026 of file normal.c.

4.19.8.129 ReadSaveHeader()

```
int ReadSaveHeader (
            void  )  [extern]
```

Reads the header in the save file and sets function pointers and flags according to the information found there. Must be called before any other ReadSave... function.

Currently works only for the exchange between 32bit and 64bit machines (WORD size must be 2 or 4 bytes)!

It is called by CoLoad().

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4136 of file store.c.

4.19.8.130 ReadSaveIndex()

```
LONG ReadSaveIndex (
            FILEINDEX * fileind )  [extern]
```

Reads a FILEINDEX from the open save file specified by AO.SaveData.Handle. Translations for adjusting endianness and data sizes are done if necessary.

Depends on the assumption that sizeof(FILEINDEX) is the same everywhere. If FILEINDEX or INDEXENTRY change, then this functions has to be adjusted.

Called by CoLoad() and FindInIndex().

Parameters

fileind	contains the read FILEINDEX after successful return. must point to allocated, big enough memory.

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4257 of file store.c.

References INFILEINDEX, FiLeInDeX::next, FiLeInDeX::number, and FuNcTiOn::number.

4.19.8.131 ReadSaveExpression()

```
LONG ReadSaveExpression (
            UBYTE * buffer,
            UBYTE * top,
            LONG * size,
            LONG * outsize )  [extern]
```

Reads an expression from the open file specified by AO.SaveData.Handle. The endianness flip and a resizing without renumbering is done in this function. Thereafter the buffer consists of chunks with a uniform maximal word size (32bit at the moment). The actual renumbering is then done by calling the function ReadSaveTerm32(). The result is returned in *buffer*.

If the translation at some point doesn't fit into the buffer anymore, the function returns and must be called again. In any case *size* returns the number of successfully read bytes, *outsize* returns the number of successfully written bytes, and the file will be positioned at the next byte after the successfully read data.

It is called by PutInStore().

Parameters

buffer	output buffer, holds the (translated) expression
top	end of buffer
size	number of read bytes
outsize	number of written bytes

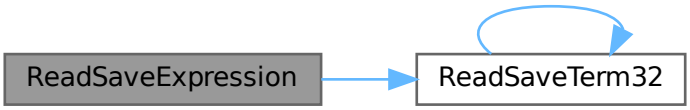
Returns

= 0 everything okay, != 0 an error occurred

Definition at line 5228 of file store.c.

References ReadSaveTerm32().

Here is the call graph for this function:



4.19.8.132 ReadSaveTerm32()

```
UBYTE * ReadSaveTerm32 (
            UBYTE * bin,
            UBYTE * binend,
            UBYTE ** bout,
            UBYTE * boutend,
            UBYTE * top,
            int terminbuf )  [extern]
```

Reads a single term from the given buffer at *bin* and write the translated term back to this buffer at *bout*.

ReadSaveTerm32() is currently the only instantiation of a ReadSaveTerm-function. It only deals with data that already has the correct endianness and that is resized to 32bit words but without being renumbered or translated in any other way. It uses the compress buffer AR.CompressBuffer.

The function is reentrant in order to cope with nested function arguments. It is called by ReadSaveExpression() and itself.

The *return value* indicates the position in the input buffer up to which the data has already been successfully processed. The parameter *bout* returns the corresponding position in the output buffer.

Parameters

bin	start of the input buffer
binend	end of the input buffer
bout	as input points to the beginning of the output buffer, as output points behind the already translated data in the output buffer
boutend	end of already decompressed data in output buffer
top	end of output buffer
terminbuf	flag whether decompressed data is already in the output buffer. used in recursive calls

Returns

pointer to the next unprocessed data in the input buffer

Definition at line 4814 of file store.c.

             UBYTE * buffer,
             UBYTE * top,
             LONG * size,
             LONG * outsize,
             INDEXENTRY * ind,
             LONG * stage )  [extern]
```

Reads the variables from the open file specified by AO.SaveData.Handle. It reads the ∗size bytes and writes them to the ∗buffer. It is called by PutInStore().

If translation is necessary, the data might shrink or grow in size, then ∗*size* is adjusted so that the reading and writing fits into the memory from the buffer to the top. The actual number of read bytes is returned in ∗*size*, the number of written bytes is returned in ∗*outsize*.

If the ∗size is smaller than the actual size of the variables, this function will be called several times and needs to remember the current position in the variable structure. The parameter *stage* does this job. When ReadSaveVariables() is called for the first time, this parameter should have the value -1.

The parameter *ind* is used to get the number of variables.

Parameters

buffer	read variables are written into this allocated memory
top	upper end of allocated memory
size	number of bytes to read. might return a smaller number of read bytes if translation was necessary
outsize	if translation has be done, outsize contains the number of written bytes
ind	pointer of INDEXENTRY for the current expression. read-only
stage	should be -1 for the first call, will be increased by ReadSaveVariables to memorize the position in the variable structure

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4445 of file store.c.

References InDeXeNtRy::nfunctions, InDeXeNtRy::nindices, InDeXeNtRy::nsymbols, InDeXeNtRy::nvectors, and FuNcTiOn::spec.

4.19.8.134 WriteStoreHeader()

```
LONG WriteStoreHeader (
            WORD handle )  [extern]
```

Writes header with information about system architecture and FORM revision to an open store file.

Called by SetFileIndex().

Parameters

handle	specifies open file to which header will be written

Returns

= 0 everything okay, != 0 an error occurred

Definition at line 4040 of file store.c.

References STOREHEADER::endianness, STOREHEADER::lenLONG, STOREHEADER::lenPOINTER, STOREHEADER::lenPOS, STOREHEADER::lenWORD, STOREHEADER::maxpower, STOREHEADER::sFun, STOREHEADER::sInd, STOREHEADER::sSym, STOREHEADER::sVec, and STOREHEADER::wildoffset.

Referenced by SetFileIndex().

4.19.8.135 InitRecovery()

```
void InitRecovery (
            void  )  [extern]
```

Sets up the strings for the filenames of the recovery files. This functions should only be called once to avoid memory leaks and after AM.TempDir has been initialized.

Definition at line 399 of file checkpoint.c.

4.19.8.136 CheckRecoveryFile()

```
int CheckRecoveryFile (
            void  )  [extern]
```

Checks whether a snapshot/recovery file exists. Returns 1 if it exists, 0 otherwise.

Definition at line 278 of file checkpoint.c.

References RecoveryFilename().

Here is the call graph for this function:

4.19.8.137 DeleteRecoveryFile()

```
void DeleteRecoveryFile (
            void  )  [extern]
```

Deletes the recovery files. It is called by CleanUp() in the case of a successful completion.

Definition at line 333 of file checkpoint.c.

4.19.8.138 RecoveryFilename()

```
char * RecoveryFilename (
            void  )  [extern]
```

Returns pointer to recovery filename.

Definition at line 364 of file checkpoint.c.

Referenced by CheckRecoveryFile(), and DoRecovery().

4.19.8.139 DoRecovery()

```
int DoRecovery (
            int * moduletype )  [extern]
```

Reads from the recovery file and restores all necessary variables and states in FORM, so that the execution can recommence in preprocessor() as if no restart of FORM had occurred.

The recovery file is read into memory as a whole. The pointer p then points into this memory at the next non-processed data. The macros by which variables are restored, like R_SET, automatically increase p appropriately.

If something goes wrong, the function returns with a non-zero value.

Allocated memory that would be lost when overwriting the global structs with data from the file is freed first. A major part of the code deals with the restoration of pointers. The idiom we use is to memorize the original pointer value (org), allocate new memory and copy the data from the file into this memory, calculate the offset between the old pointer value and the new allocated memory position (ofs), and then correct all affected pointers (+=ofs).

We rely on the fact that several variables (especially in AM) are already assigned the correct values by the startup functions. That means, in principle, that a change in the setup files between snapshot creation and recovery will be noticed.

Definition at line 2224 of file tools.c.

4.19.8.146 TestTerm()

```
int TestTerm (
            WORD * term )  [extern]
```

Tests the consistency of the term. Returns 0 when the term is OK. Any nonzero value is trouble. In the current version the testing isn't 100% complete. For instance, we don't check the validity of the symbols nor do we check the range of their powers. Etc. This should be extended when the need is there.

Parameters

term	the term to be tested

Definition at line 3812 of file tools.c.

References TestTerm().

Referenced by TestTerm().

            WORD par )  [extern]
```

Converts a generic term to polynomial notation in which there are only symbols and brackets. During conversion there will be only symbols. Brackets are stripped. Objects that need 'translation' are put inside a special compiler buffer and represented by a symbol. The numbering of the extra symbols is down from the maximum. In principle there can be a problem when running into the already assigned ones. This uses the FindTree for searching in the global tree and then looks further in the AT.ebufnum. This allows fully parallel processing. Hence we need no locks. Cannot be used in the same module as ConvertToPoly.

Definition at line 514 of file notation.c.

```
WORD * TakeSymbolContent (
            PHEAD WORD * in,
            WORD * term )  [extern]
```

Implements part of the old ExecArg in which we take common factors from arguments with more than one term. We allow only symbols as this code is used for the polyratfun only. We have a special routine, because the generic TakeContent does too much work and speed is at a premium here. Input: in is the input expression as a sequence of terms. Output: term: the content return value: the contentfree expression. it is in new allocation, made by TermMalloc. (should be in a TermMalloc space?)

Definition at line 2493 of file ratio.c.

```
WORD * TakeContent (
            PHEAD WORD * in,
            WORD * term )  [extern]
```

Implements part of the old ExecArg in which we take common factors from arguments with more than one term. Here the input is a sequence of terms in 'in' and the answer is a content-free sequence of terms. This sequence has been allocated by the Malloc1 routine in a call to EndSort, unless the expression was already content-free. In that case the input pointer is returned. The content is returned in term. This is supposed to be a separate allocation, made by TermMalloc in the calling routine.

```

Definition at line 2824 of file dollar.c.

4.19.8.212 poly_gcd()

```
WORD * poly_gcd (
             PHEAD WORD * a,
             WORD * b,
             WORD fit )  [extern]
```

Polynomial gcd

4.19.9 Description

This method calculates the greatest common divisor of two polynomials, given by two zero-terminated Form-style term lists.

4.19.10 Notes

- The result is written at newly allocated memory
- Called from ratio.c
- Calls polygcd::gcd

Definition at line 124 of file polywrap.cc.

References poly_determine_modulus().

Here is the call graph for this function:

4.19.10.1 poly_div()

```
WORD * poly_div (
             PHEAD WORD * a,
             WORD * b,
             WORD fit )  [extern]
```

Definition at line 437 of file polywrap.cc.

4.19.10.2 poly_rem()

```
WORD * poly_rem (
             PHEAD WORD * a,
             WORD * b,
             WORD fit )  [extern]
```

Definition at line 465 of file polywrap.cc.

4.19.10.3 poly_inverse()

```
WORD * poly_inverse (
             PHEAD WORD * arga,
             WORD * argb )  [extern]
```

Definition at line 1757 of file polywrap.cc.

4.19.10.4 poly_mul()

```
WORD * poly_mul (
            PHEAD WORD * a,
            WORD * b )  [extern]
```

Definition at line 1962 of file polywrap.cc.

4.19.10.5 poly_ratfun_add()

```
WORD * poly_ratfun_add (
            PHEAD WORD * t1,
            WORD * t2 )  [extern]
```

Addition of PolyRatFuns

4.19.11 Description

This method gets two pointers to polyratfuns with up to two arguments each and calculates the sum.

4.19.12 Notes

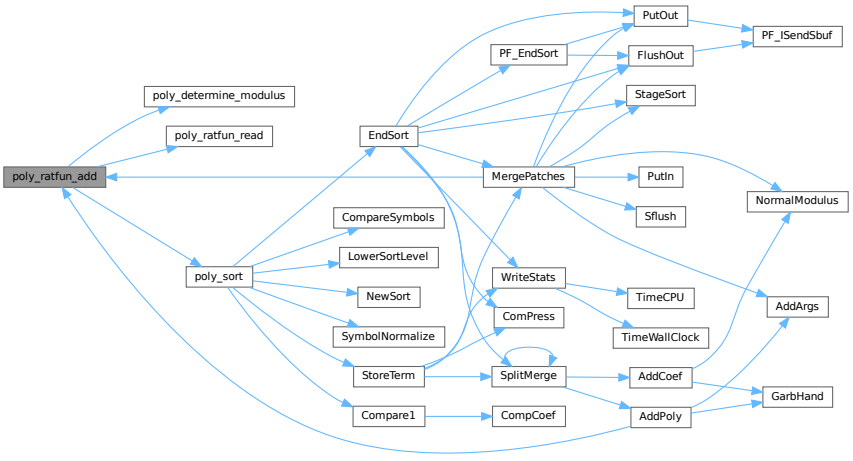
- The result is written at the workpointer
- Called from sort.c and threads.c
- Calls poly::operators and polygcd::gcd

Definition at line 635 of file polywrap.cc.

References poly_determine_modulus(), poly_ratfun_read(), and poly_sort().

Referenced by AddPoly(), and MergePatches().

Here is the call graph for this function:



4.19.12.1 poly_ratfun_normalize()

```
int poly_ratfun_normalize (
            PHEAD WORD * term )  [extern]
```

Multiplication/normalization of PolyRatFuns

4.19.13 Description

This method searches a term for multiple polyratfuns and multiplies their contents. The result is properly normalized. Normalization also works for terms with a single polyratfun.

4.19.14 Notes

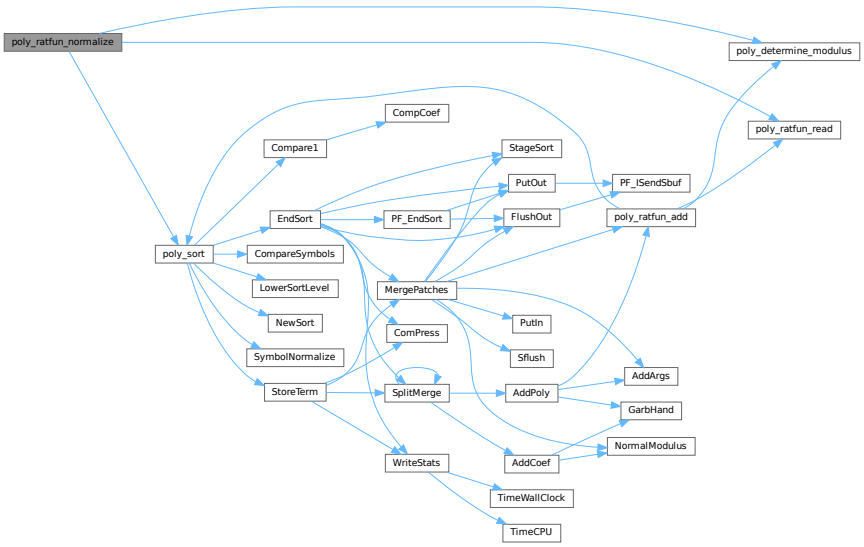
- The result overwrites the original term
- Called from proces.c
- Calls poly::operators and polygcd::gcd

Definition at line 771 of file polywrap.cc.

References poly_determine_modulus(), poly_ratfun_read(), and poly_sort().

Referenced by PolyFunMul(), and PrepPoly().

Here is the call graph for this function:



4.19.14.1 poly_factorize_argument()

```
int poly_factorize_argument (
            PHEAD WORD * argin,
            WORD * argout )  [extern]
```

Factorization of function arguments

4.19.15 Description

This method factorizes the Form-style argument argin.

4.19.16 Notes

- The result is written at argout
- Called from argument.c
- Calls poly_factorize

Definition at line 1114 of file polywrap.cc.

References poly_factorize().

Here is the call graph for this function:

4.19.16.1 poly_factorize_dollar()

```
WORD * poly_factorize_dollar (
            PHEAD WORD * argin )  [extern]
```

Factorization of dollar variables

4.19.17 Description

This method factorizes a dollar variable.

4.19.18 Notes

- The result is written at newly allocated memory.
- Called from dollar.c
- Calls poly_factorize

Definition at line 1148 of file polywrap.cc.

References poly_factorize().

Here is the call graph for this function:

4.19.18.1 poly_factorize_expression()

```
int poly_factorize_expression (
            EXPRESSIONS expr )  [extern]
```

Factorization of expressions

4.19.19 Description

This method factorizes an expression.

4.19.20 Notes

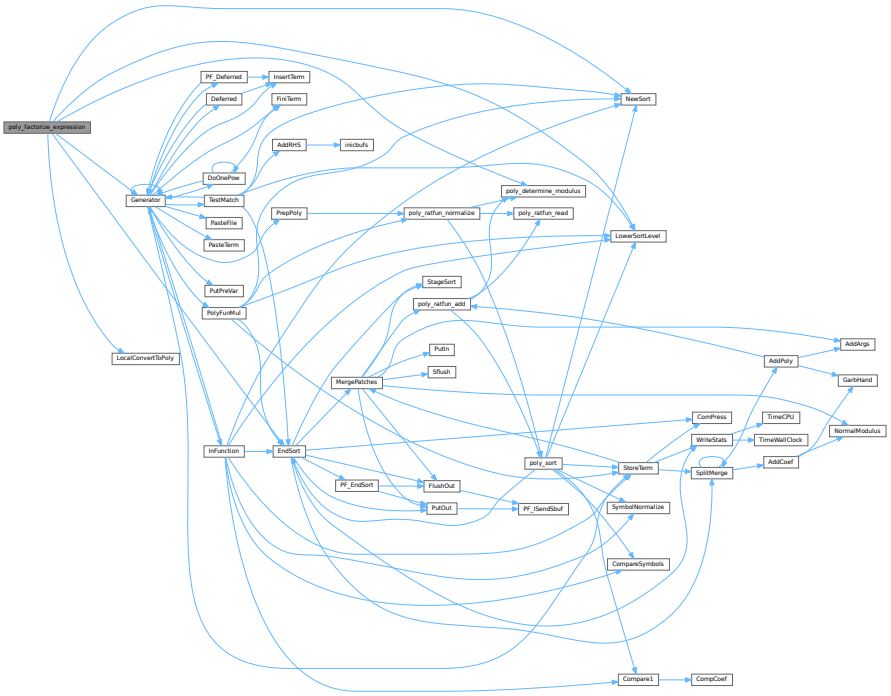
- The result overwrites the input expression
- Called from proces.c
- Calls polyfact::factorize

Definition at line 1180 of file polywrap.cc.

References EndSort(), Generator(), FiLe::handle, LocalConvertToPoly(), LowerSortLevel(), NewSort(), and poly_determine_modulus().

Referenced by PF_Processor(), and Processor().

Here is the call graph for this function:



4.19.20.1 poly_unfactorize_expression()

```
int poly_unfactorize_expression (
            EXPRESSIONS expr )  [extern]
```

Unfactorization of expressions

4.19.21 Description

This method expands a factorized expression.

4.19.22 Notes

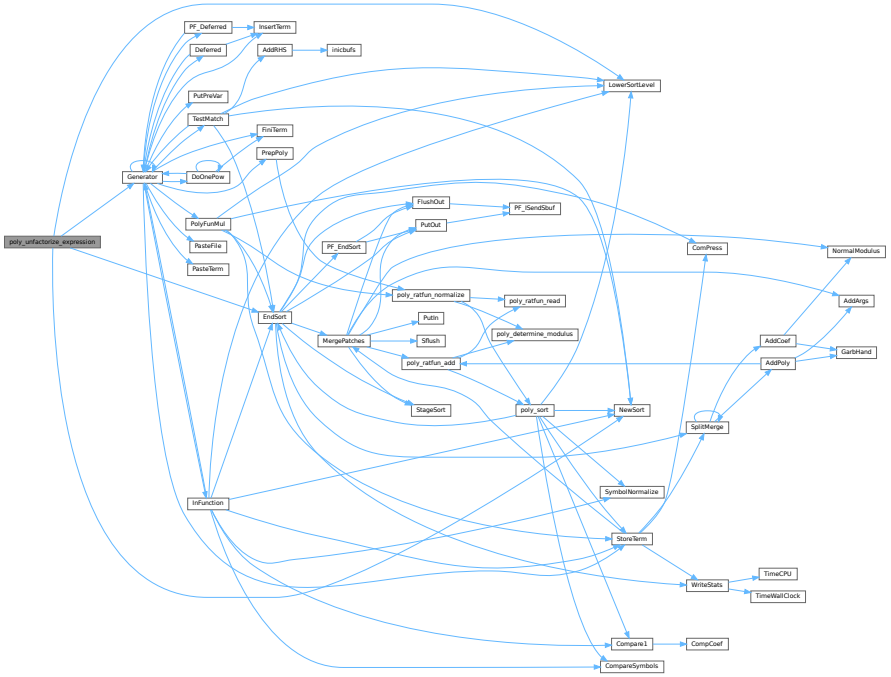
- The result overwrites the input expression
- Called from proces.c

Definition at line 1545 of file polywrap.cc.

References EndSort(), Generator(), FiLe::handle, LowerSortLevel(), and NewSort().

Referenced by PF_Processor(), and Processor().

Here is the call graph for this function:



4.19.22.1 poly_free_poly_vars()

```
void poly_free_poly_vars (
            PHEAD const char * text )  [extern]

```

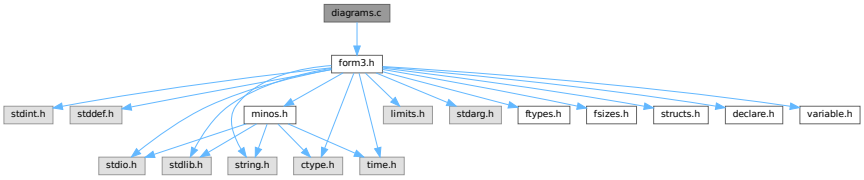
Include dependency graph for diagrams.c:



Functions

- int CoCanonicalize (UBYTE ∗s)
- int DoCanonicalize (PHEAD WORD ∗term, WORD ∗params)
- int DoTopologyCanonicalize (PHEAD WORD ∗term, WORD vert, WORD edge, WORD ∗args)
- int DoShattering (PHEAD WORD ∗connect, WORD ∗environ, WORD ∗partitions, WORD nvert)

4.21.1 Detailed Description

Contains the wrapper routines for diagram manipulations.

Definition in file diagrams.c.

4.21.2 Function Documentation

4.21.2.1 CoCanonicalize()

```
int CoCanonicalize (
            UBYTE * s )
```

Definition at line 64 of file diagrams.c.

4.21.2.2 DoCanonicalize()

```
int DoCanonicalize (
            PHEAD WORD * term,
            WORD * params )
```

Definition at line 185 of file diagrams.c.

4.21.2.3 DoTopologyCanonicalize()

```
int DoTopologyCanonicalize (
              PHEAD WORD * term,
              WORD vert,
              WORD edge,
              WORD * args )
```

Definition at line 346 of file diagrams.c.

4.21.2.4 DoShattering()

```
int DoShattering (
              PHEAD WORD * connect,
              WORD * environ,
              WORD * partitions,
              WORD nvert )
```

Definition at line 555 of file diagrams.c.

00036
00037 static WORD one = 1;
00038
00039 /*
00040     #] Includes :
00041     #[ CoCanonicalize :
00042
00043     Syntax:
00044         Canonicalize,mainoption,...
00045     With the main options currently:
00046         Canonicalize,topology,vertexfunction,edgefunction,OutDollar,extraoptions;
00047         Canonicalize,polynomial,InDollar,set_or_setname_or_dollar,OutDollar,extraoptions;
00048     The vertex function needs to have the format (assume it is called vx):
00049         vx(p1,p2,-p3)  or vx(-p1,p2,p3,-p4) etc.
```

```
00050     The external lines have a vertex with only one line.
00051     All momenta that form connections should be unique.
00052     In principle the - signs are not relevant for the topology, but they
00053     may exist already in the remaining part of the diagram. They are also
00054     part of the canonical form.
00055     The edge function can be used in different ways, depending on the options.
00056     The extraoption(s) should be nonnegative integers or $variables that evaluate
00057     into nonnegative integers (integers less than 2^31).
00058     The Indollar variable contains the polynomial to be canonicalized.
00059     The OutDollar variable should be the name of a $-variable (as in $out) which
00060     will be filled with a replace_ function. The canonicalization can then
00061     be executed in the whole term with the   Multiply $out;  command.

4.23.1 Detailed Description

Functions with interface FORM with grcc, to implement the diagrams_ function.

Definition in file diawrap.cc.

4.23.2 Macro Definition Documentation

4.23.2.1 MAXPOINTS

```
#define MAXPOINTS 120
```

Definition at line 41 of file diawrap.cc.

4.23.3 Function Documentation

4.23.3.1 LoadModel()

```
int LoadModel (
            MODEL * m )
```

Definition at line 58 of file diawrap.cc.

4.23.3.2 ConvertParticle()

```
int ConvertParticle (
            Model * model,
            int formnum )
```

Definition at line 205 of file diawrap.cc.

4.23.3.3 ReConvertParticle()

```
int ReConvertParticle (
            Model * model,
            int grccnum )
```

Definition at line 223 of file diawrap.cc.

4.23.3.4 numParticle()

```
int numParticle (
            MODEL * m,
            WORD n )
```

Definition at line 235 of file diawrap.cc.

4.23.3.5 fendMG()

```
Bool fendMG (
            EGraph * eg,
            void * ti )
```

Definition at line 506 of file diawrap.cc.

4.23.3.6 ProcessTopology()

```
Bool ProcessTopology (
            EGraph * eg,
            void * ti )
```

Definition at line 516 of file diawrap.cc.

4.23.3.7 SetDualOpts()

```
void SetDualOpts (
            int * opt,
            const WORD num,
            const int key,
            const char * key_name,
            const int dual,
            const char * dual_name,
            const int val,
            const int dval )
```

Definition at line 779 of file diawrap.cc.

4.23.3.8 GenDiagrams()

```
int GenDiagrams (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 806 of file diawrap.cc.

4.25.1 Detailed Description

Contains the code pertaining to dictionaries Commands are: #opendictionary name #closedictionary #selectdictionary name <options> There can be several dictionaries, but only one can be active. Defining elements is done with #add object: "replacement" Replacements are strings when a dictionary is for output translation. Objects can be 1: a number (rational) 2: a variable 3: * ^ 4: a function with arguments

Definition in file dict.c.

4.25.2 Function Documentation

4.25.2.1 TransformRational()

```
void TransformRational (
            UWORD * a,
            WORD na )
```

Definition at line 71 of file dict.c.

4.25.2.2 IsMultiplySign()

```
UBYTE * IsMultiplySign (
            void  )
```

Definition at line 218 of file dict.c.

4.25.2.3 IsExponentSign()

```
UBYTE * IsExponentSign (
            void  )
```

Definition at line 238 of file dict.c.

4.25.2.4 FindSymbol()

```
UBYTE * FindSymbol (
            WORD num )
```

Definition at line 258 of file dict.c.

4.25.2.5 FindVector()

```
UBYTE * FindVector (
            WORD num )
```

Definition at line 279 of file dict.c.

4.25.2.6 FindIndex()

```
UBYTE * FindIndex (
            WORD num )
```

Definition at line 301 of file dict.c.

4.25.2.7 FindFunction()

```
UBYTE * FindFunction (
            WORD num )
```

Definition at line 323 of file dict.c.

4.25.2.8 FindFunWithArgs()

```
UBYTE * FindFunWithArgs (
            WORD * t )
```

Definition at line 345 of file dict.c.

4.25.2.9 FindExtraSymbol()

```
UBYTE * FindExtraSymbol (
            WORD num )
```

Definition at line 377 of file dict.c.

4.25.2.10 FindDictionary()

```
int FindDictionary (
            UBYTE * name )
```

Definition at line 434 of file dict.c.

4.25.2.11 AddDictionary()

```
int AddDictionary (
            UBYTE * name )
```

Definition at line 449 of file dict.c.

4.25.2.12 AddToDictionary()

```
int AddToDictionary (
            DICTIONARY * dict,
            UBYTE * left,
            UBYTE * right )
```

Definition at line 491 of file dict.c.

4.25.2.13 UseDictionary()

```
int UseDictionary (
            UBYTE * name,
            UBYTE * options )
```

Definition at line 766 of file dict.c.

4.25.2.14 SetDictionaryOptions()

```
int SetDictionaryOptions (
            UBYTE * options )
```

Definition at line 790 of file dict.c.

4.25.2.15 UnSetDictionary()

```
void UnSetDictionary (
            void  )
```

Definition at line 883 of file dict.c.

4.25.2.16 RemoveDictionary()

```
void RemoveDictionary (
            DICTIONARY * dict )
```

Definition at line 902 of file dict.c.

4.25.2.17 ShrinkDictionary()

```
void ShrinkDictionary (
            DICTIONARY * dict )
```

Definition at line 945 of file dict.c.

4.25.2.18 DoPreOpenDictionary()

```
int DoPreOpenDictionary (
            UBYTE * s )
```

Definition at line 959 of file dict.c.

4.25.2.19 DoPreCloseDictionary()

```
int DoPreCloseDictionary (
            UBYTE * s )
```

Definition at line 998 of file dict.c.

4.25.2.20 DoPreUseDictionary()

```
int DoPreUseDictionary (
            UBYTE * s )
```

Definition at line 1022 of file dict.c.

4.25.2.21 DoPreAdd()

```
int DoPreAdd (
            UBYTE * s )
```

Definition at line 1067 of file dict.c.

4.25.2.22 DictToBytes()

```
LONG DictToBytes (
            DICTIONARY * dict,
            UBYTE * buf )
```

Definition at line 1119 of file dict.c.

4.25.2.23 DictFromBytes()

```
DICTIONARY * DictFromBytes (
            UBYTE * buf )
```

Definition at line 1152 of file dict.c.

4.27.1 Detailed Description

The routines that deal with the dollar variables. The name administration is to be found in the file names.c

Definition in file dollar.c.

4.27.2 Macro Definition Documentation

4.27.2.1 STEP2

```
#define STEP2
```

Factors a dollar expression. Notation: d->nfactors becomes nonzero. if the number of factors is one, we leave d->factors zero. Otherwise factors is an array of pointers to the factors. These are pointers of the type FAC-DOLLAR. fd->where pointer to contents in term notation fd->size size of the buffer fd->where points to fd->type DOLNUMBER or DOLTERMS fd->value value if type is DOLNUMBER and it fits in a WORD.

Definition at line 2937 of file dollar.c.

4.27.3 Function Documentation

4.27.3.1 CatchDollar()

```
int CatchDollar (
            int par )
```

Definition at line 52 of file dollar.c.

4.27.3.2 AssignDollar()

```
int AssignDollar (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 207 of file dollar.c.

4.27.3.3 WriteDollarToBuffer()

```
UBYTE * WriteDollarToBuffer (
            WORD numdollar,
            WORD par )
```

Definition at line 581 of file dollar.c.

4.27.3.4 WriteDollarFactorToBuffer()

```
UBYTE * WriteDollarFactorToBuffer (
            WORD numdollar,
            WORD numfac,
            WORD par )
```

Definition at line 672 of file dollar.c.

4.27.3.5 AddToDollarBuffer()

```
void AddToDollarBuffer (
            UBYTE * s )
```

Definition at line 747 of file dollar.c.

4.27.3.6 TermAssign()

```
void TermAssign (
            WORD * term )
```

Definition at line 788 of file dollar.c.

4.27.3.7 PutTermInDollar()

```
int PutTermInDollar (
            WORD * term,
            WORD numdollar )
```

Definition at line 848 of file dollar.c.

4.27.3.8 WildDollars()

```
void WildDollars (
            PHEAD WORD * term )
```

Definition at line 876 of file dollar.c.

4.27.3.9 DolToTensor()

```
WORD DolToTensor (
            PHEAD WORD numdollar )
```

Definition at line 1069 of file dollar.c.

4.27.3.10 DolToFunction()

```
WORD DolToFunction (
            PHEAD WORD numdollar )
```

Definition at line 1130 of file dollar.c.

4.27.3.11 DolToVector()

```
WORD DolToVector (
            PHEAD WORD numdollar )
```

Definition at line 1187 of file dollar.c.

4.27.3.12 DolToNumber()

```
WORD DolToNumber (
            PHEAD WORD numdollar )
```

Definition at line 1251 of file dollar.c.

4.27.3.13 DolToSymbol()

```
WORD DolToSymbol (
            PHEAD WORD numdollar )
```

Definition at line 1310 of file dollar.c.

4.27.3.14 DolToIndex()

```
WORD DolToIndex (

4.27.3.28 EvalDoLoopArg()

```
WORD EvalDoLoopArg (
            PHEAD WORD * arg,
            WORD par )
```

Evaluates one argument of a do loop. Such an argument is constructed from SNUMBERs DOLLAREXPRESSIONs and possibly DOLLAREXPR2s which indicate factors of the preceding dollar. Hence we have SNUMBER,num DOLLAREXPRESSION,numdollar DOLLAREXPRESSION,numdollar,DOLLAREXPR2,numfactor DOLLAREXPRESSION,numdollar,DOLLAREXPR2,numfactor,DOLLAREXPR2,numfactor etc. Because we have a do-loop at every stage we should have a number. The notation in DOLLAREXPR2 is that $>= 0$ is number of yet another dollar and < 0 is -n-1 with n the array element or zero. The return value is the (short) number. The routine works its way through the list in a recursive manner.

4.27.3.33 TakeDollarContent()

```
WORD * TakeDollarContent (
            PHEAD WORD * dollarbuffer,
            WORD ** factor )
```

Definition at line 3560 of file dollar.c.

4.27.3.34 MakeDollarInteger()

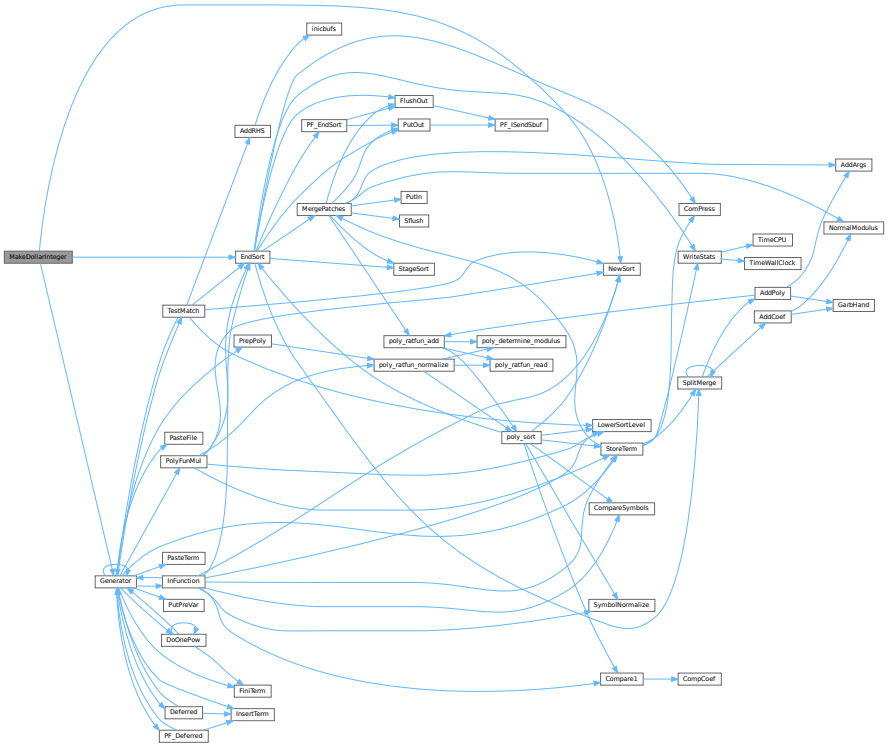
```
WORD * MakeDollarInteger (
            PHEAD WORD * bufin,
            WORD ** bufout )
```

For normalizing everything to integers we have to determine for all elements of this argument the LCM of the denominators and the GCD of the numerators. The input argument is in bufin. The number that comes out is the return value. The normalized argument is in bufout.

Definition at line 3612 of file dollar.c.

References EndSort(), Generator(), and NewSort().

Here is the call graph for this function:



4.27.3.35 MakeDollarMod()

```
WORD * MakeDollarMod (
            PHEAD WORD * buffer,
            WORD ** bufout )
```

Similar to MakeDollarInteger but now with modulus arithmetic using only a one WORD 'prime'. We make the coefficient of the first term in the argument equal to one. Already the coefficients are taken modulus AN.cmod and AN.ncmod == 1

```

Definition at line 3831 of file dollar.c.

4.27.3.37 AddPotModdollar()

```
void AddPotModdollar (
            WORD numdollar )
```

Adds a $-variable specified by *numdollar* to the list of potentially modified $-variables unless it has already been included in the list.

Parameters

numdollar	The index of the $-variable to be added.

4.29.1 Detailed Description

Evaluation of functions for the floating-point system, by interfacing with MPFR.

Definition in file evaluate.c.

4.29.2 Macro Definition Documentation

4.29.2.1 EXTRAPRECISION

```
#define EXTRAPRECISION 4
```

Definition at line 39 of file evaluate.c.

4.29.2.2 RND

```
#define RND MPFR_RNDN
```

Definition at line 41 of file evaluate.c.

4.29.2.3 auxr1

```
#define auxr1 (((mpfr_t *)(AT.auxr_))[0])
```

Definition at line 43 of file evaluate.c.

4.29.2.4 auxr2

```
#define auxr2 (((mpfr_t *)(AT.auxr_))[1])
```

Definition at line 44 of file evaluate.c.

4.29.2.5 auxr3

```
#define auxr3 (((mpfr_t *)(AT.auxr_))[2])
```

Definition at line 45 of file evaluate.c.

4.29.2.6 auxr4

```
#define auxr4 (((mpfr_t *)(AT.auxr_))[3])
```

Definition at line 46 of file evaluate.c.

4.29.2.7 auxr5

```
#define auxr5 (((mpfr_t *)(AT.auxr_))[4])
```

Definition at line 47 of file evaluate.c.

4.29.3 Function Documentation

4.29.3.1 PackFloat()

```
int PackFloat (
            WORD * fun,
            mpf_t infloat )
```

Definition at line 271 of file float.c.

4.29.3.2 UnpackFloat()

```
int UnpackFloat (
            mpf_t outfloat,
            WORD * fun )
```

Definition at line 366 of file float.c.

4.29.3.3 RatToFloat()

```
void RatToFloat (
            mpf_t result,
            UWORD * formrat,
            int ratsize )
```

Definition at line 624 of file float.c.

4.29.3.4 FormtoZ()

```
void FormtoZ (
            mpz_t z,
            UWORD * a,
            WORD na )
```

Definition at line 515 of file float.c.

4.29.3.5 IntegerToFloatr()

```
void IntegerToFloatr (
            mpfr_t result,
            UWORD * formlong,
            int longsize )
```

Definition at line 65 of file evaluate.c.

4.29.3.6 RatToFloatr()

```
void RatToFloatr (
            mpfr_t result,
            UWORD * formrat,
            int ratsize )
```

Definition at line 81 of file evaluate.c.

4.29.3.7 SetfFloatPrecision()

```
void SetfFloatPrecision (
            LONG prec )
```

Definition at line 108 of file evaluate.c.

4.29.3.8 ClearfFloat()

```
void ClearfFloat (
            void  )
```

Definition at line 141 of file evaluate.c.

4.29.3.9 GetFloatArgument()

```
int GetFloatArgument (
            PHEAD mpfr_t f_out,
            WORD * fun,
            int par )
```

Definition at line 180 of file evaluate.c.

4.29.3.10 GetPiArgument()

```
int GetPiArgument (
            PHEAD WORD * arg )
```

Definition at line 277 of file evaluate.c.

4.29.3.11 EvaluateFun()

```
int EvaluateFun (
            PHEAD WORD * term,
            WORD level,
            WORD * pars )
```

Definition at line 370 of file evaluate.c.

4.29.4 Variable Documentation

4.29.4.1 ln2

```
mpf_t ln2
```

Definition at line 49 of file evaluate.c.

4.30 evaluate.c

00343         #] GetPiArgument :
00344         #[ EvaluateFun :
00345
00346         What we need to do is:
00347         1: look for a function to be treated.
00348         2: make sure its argument is treatable.
00349         3: call the proper mpfr_ function.
00350         4: accumulate the result.
00351         For some functions we have to insert 'smart' shortcuts as is
00352         the case with sin_(pi_) or sin_(pi_/6) of sqrt(4/9) etc.
00353         Otherwise we may have to insert a value for pi_ first.
00354         There are several types of arguments:
00355         a: (short) integers.
00356         b: rationals.
00357         c: floats.
00358         We accumulate the result(s) in auxr2. The argument comes in aux5
00359         and a result in auxr3 which then gets multiplied into auxr2.
00360         In the end we have to combine auxr2 with whatever coefficient
00361         existed already.
00362
00363         When the float system is started we need for aux only 3 variables
00364         per thread. auxr1-auxr3. This should be done separately.
00365         The main problem is the conversion of mpfr_t to float_ and/or mpf_t
00366         and back.

4.31.1 Detailed Description

The routines that start the execution phase of a module. It also contains the routines for placing the bracket subterm.

Definition in file execute.c.

4.31.2 Macro Definition Documentation

4.31.2.1 CURRENTBRACKET

```
#define CURRENTBRACKET 1
```

Definition at line 2672 of file execute.c.

4.31.2.2 BRACKETCURRENTEXPR

```
#define BRACKETCURRENTEXPR 2
```

Definition at line 2673 of file execute.c.

4.31.2.3 BRACKETOTHEREXPR

```
#define BRACKETOTHEREXPR 3
```

Definition at line 2674 of file execute.c.

4.31.2.4 NOBRACKETACTIVE

```
#define NOBRACKETACTIVE 4
```

Definition at line 2675 of file execute.c.

4.31.3 Function Documentation

4.31.3.1 CleanExpr()

```
int CleanExpr (
            WORD par )
```

Definition at line 47 of file execute.c.

4.31.3.2 PopVariables()

```
int PopVariables (
            void  )
```

Definition at line 211 of file execute.c.

4.31.3.3 MakeGlobal()

```
void MakeGlobal (
            void  )
```

Definition at line 383 of file execute.c.

4.31.3.4 TestDrop()

```
void TestDrop (
            void  )
```

Definition at line 484 of file execute.c.

4.31.3.5 PutInVflags()

```
void PutInVflags (
            WORD nexpr )
```

Definition at line 562 of file execute.c.

4.31.3.6 DoExecute()

```
int DoExecute (
            WORD par,
            WORD skip )
```

Definition at line 616 of file execute.c.

4.31.3.7 PutBracket()

```
int PutBracket (
            PHEAD WORD * termin )
```

Definition at line 1214 of file execute.c.

4.31.3.8 SpecialCleanup()

```
void SpecialCleanup (
            PHEAD0  )
```

Definition at line 1728 of file execute.c.

4.31.3.9 SetMods()

```
void SetMods (
            void  )
```

Definition at line 1742 of file execute.c.

4.31.3.10 UnSetMods()

```
void UnSetMods (
            void  )
```

Definition at line 1760 of file execute.c.

4.31.3.11 ExchangeExpressions()

```
void ExchangeExpressions (
            int num1,
            int num2 )
```

Definition at line 1775 of file execute.c.

4.31.3.12 GetFirstBracket()

```
int GetFirstBracket (
            WORD * term,
            int num )
```

Definition at line 1853 of file execute.c.

4.31.3.13 GetFirstTerm()

```
int GetFirstTerm (
            WORD * term,
            int num,
            int pre )
```

Gets the first term of an expression. Routine should be thread safe.

Parameters

out	*term*	Pointer to the buffer where the term should be written.
in	*num*	The expression number from which to get the term.
in	*pre*	Denotes a pre-processor call (1) or not (0). Used to determine the correct source file for the expression.

Returns

First WORD of term, a negative value denotes an error.

Definition at line 1972 of file execute.c.

References FiLe::handle, VaRrEnUm::lo, and ReNuMbEr::symb.

4.31.3.14 GetContent()

```
int GetContent (
            WORD * content,
            int num )
```

Definition at line 2080 of file execute.c.

4.31.3.15 CleanupTerm()

```
int CleanupTerm (
            WORD * term )
```

Definition at line 2197 of file execute.c.

4.31.3.16 ContentMerge()

```
WORD ContentMerge (
            PHEAD WORD * content,
            WORD * term )
```

Definition at line 2221 of file execute.c.

4.31.3.17 TermsInExpression()

```
LONG TermsInExpression (
            WORD num )
```

Definition at line 2485 of file execute.c.

4.31.3.18 SizeOfExpression()

```
LONG SizeOfExpression (
            WORD num )
```

Definition at line 2497 of file execute.c.

4.31.3.19 UpdatePositions()

```
void UpdatePositions (
            void  )
```

Definition at line 2509 of file execute.c.

4.31.3.20 CountTerms1()

```
LONG CountTerms1 (
            PHEAD0  )
```

Definition at line 2569 of file execute.c.

4.31.3.21 TermsInBracket()

```
LONG TermsInBracket (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 2677 of file execute.c.
