01196
01197     Routine uses the bracket info to split a term into two pieces:
01198     1: the part outside the bracket, and
01199     2: the part inside the bracket.
01200     These parts are separated by a subterm of type HAAKJE.
01201     This subterm looks like: HAAKJE,3,level
01202     The level is used for nestings of brackets. The print routines
01203     cannot handle this yet (31-Mar-1988).
01204
01205     The Bracket selector is in AT.BrackBuf in the form of a regular term,
```

```
01206     but without coefficient.
01207     When AR.BracketOn < 0 we have a socalled antibracket. The main effect
01208     is an exchange of the inner and outer part and where the coefficient goes.
01209

4.33.1 Detailed Description

The system that takes care of communication with external programs.

Definition in file extcmd.c.

4.33.2 Function Documentation

4.33.2.1 openExternalChannel()

```
int openExternalChannel (
            UBYTE * cmd,
            int daemonize,
            UBYTE * shellname,
            UBYTE * stderrname )
```

Definition at line 230 of file extcmd.c.

4.33.2.2 initPresetExternalChannels()

```
int initPresetExternalChannels (
            UBYTE * theline,
            int thetimeout )
```

Definition at line 232 of file extcmd.c.

4.33.2.3 closeExternalChannel()

```
int closeExternalChannel (
            int n )
```

Definition at line 233 of file extcmd.c.

4.33.2.4 selectExternalChannel()

```
int selectExternalChannel (
            int n )
```

Definition at line 234 of file extcmd.c.

4.33.2.5 getCurrentExternalChannel()

```
int getCurrentExternalChannel (
            void  )
```

Definition at line 235 of file extcmd.c.

4.33.2.6 closeAllExternalChannels()

```
void closeAllExternalChannels (
            void  )
```

Definition at line 236 of file extcmd.c.

00032     #[ Documentation :
```

```
00033
00034     This module is written by M.Tentyukov as a part of implementation of
00035     interaction between FORM and external processes, first release
00036     09.04.2004. A part of this code is copied from the DIANA project, which was
00037     written by M. Tentyukov and published under the GPL version 2 as
00038     published by the Free Software Foundation.
00039
00040     This file is completely re-written by M.Tentyukov in May 2006.
00041     Since the interface was changed, the public function were changed,
00042     also. A new public functions were added: initPresetExternalChannels()
00043     (see comments just before this function in the present file) and
00044     setKillModeForExternalChannel (a pointer, not a function).
00045
00046     If a macro WITHEXTERNALCHANNEL is not defined, all public functions
00047     are stubs returning failure.
00048
00049     The idea is to start an external command  swallowing
00050     its stdin and stdout. This can be done by means of the function
00051     int openExternalChannel(cmd,daemonize,shellname,stderrname), where
00052     cmd is a command to run,
00053     daemonize: if !=0 then start the command in the "daemon" mode,
00054     shellname: if !=NULL, execute the command in a subshell,
00055     stderrname: if != NULL, redirect stderr of the command to this file.
00056     The function returns some small positive integer number (the
00057     descriptor of a newly created external channel), or -1 on failure.
00058
00059     After the command is started, it becomes a _current_ opened external
00060     channel. The buffer can be sent to its stdin by a function
00061     int writeBufToExtChannel(buf, n)
00062     (here buf is a pointer to the buffer, n is the length in bytes; the
00063     function returns 0 in success, or -1 on failure),
00064     or one character can be read from its stdout by
00065     means of the function
00066     int getcFromExtChannel().
00067
00068     The latter returns the
00069     character casted to integer, or something <0. This can be -2 (if there
00070     is no current external channel) or EOF, if the external program closes
00071     its stdout, or if the external program outputs a string coinciding
00072     with a _terminator_.
00073
00074     By default, the terminator if an empty line. For the current external
00075     channel it can be set by means of the function
00076     int setTerminatorForExternalChannel(newterminator).
00077     The function returns 0 in success, or !0 if something is wrong (no
00078     current channel, too long terminator).
00079
00080     After getcFromExtChannel() returns EOF, the current channel becomes
00081     undefined. Any further attempts to read information by
00082     getcFromExtChannel() result in -2. To set (re-set) a current channel,
00083     the function
00084     int selectExternalChannel(n)
00085     can be used. This function accepts the valid external channel
00086     descriptor (returned by openExternalChannel) and returns the
00087     descriptor of a previous current channel (0, if there was no current
00088     channel, or -1, if the external channel descriptor is invalid).
00089     If n == 0, the function undefine the current external channel.
00090
00091     The function
00092     int closeExternalChannel(n)
00093     destroys the opened external channel with the descriptor n. It returns
00094     0 in success, or -1 on failure. If the corresponding external channel
00095     was the current one, the current channel becomes undefined. If n==0,
00096     the function closes the current external channel.
00097
00098     The function
00099     int getCurrentExternalChannel(void)
00100     returns the descriptor if the current external channel, or 0 , if
00101     there is no current external channel.
00102
00103     The function
00104     void closeAllExternalChannels(void)
00105
00106     destroys all opened external channels.
00107
00108     List of all public functions:
00109     int openExternalChannel(UBYTE *cmd,int daemonize,UBYTE *shellname, UBYTE * stderrname);
00110     int initPresetExternalChannels(UBYTE *theline, int thetimeout);
00111     int setTerminatorForExternalChannel(char *newterminator);
00112     int setKillModeForExternalChannel(int signum, int sentToWholeGroup);
00113     int closeExternalChannel(int n);
00114     int selectExternalChannel(int n);
00115     int writeBufToExtChannel(char *buf,int n);
00116     int getcFromExtChannel(void);
00117     int getCurrentExternalChannel(void);
00118     void closeAllExternalChannels(void);
00119
```

```
00120     ATTENTION!
00121
00122     Four of them:
00123     1 setTerminatorForExternalChannel
00124     2 setKillModeForExternalChannel
00125     3 writeBufToExtChannel
00126     4 getcFromExtChannel
00127
00128     are NOT functions, but variables (pointers) of a corrsponding type.
00129     They are initialised by proper values to avoid repeated error checking.
00130
00131     All public functions are independent of realization hidden in this module.
00132     All other functions may have a returned type/parameters type local w.r.t.
00133     this module; they are not declared outside of this file.

- WORD FindMulti (PHEAD WORD ∗term, WORD ∗pattern)
- int FindRest (PHEAD WORD ∗term, WORD ∗pattern)

4.39.1 Detailed Description

Pattern matching of symbols and dotproducts. There are various routines because of the options in the id-statements like once, only, multi and many. These are among the oldest routines in FORM and that can be noticed, because the interplay with the function matching is not complete. When we match functions and halfway we fail we can backtrack properly. With the symbols, the dotproducts and the vectors (in pattern.c) there is no proper backtracking. Hence the routines here need still quite some work or may even have to be rewritten.

4.39.2 Function Documentation

4.39.2.1 FindOnly()

```
int FindOnly (
            PHEAD WORD * term,
            WORD * pattern )
```

Definition at line 61 of file findpat.c.

4.39.2.2 FindOnce()

```
int FindOnce (
              PHEAD WORD * term,
              WORD * pattern )
```

Definition at line 419 of file findpat.c.

4.39.2.3 FindMulti()

```
WORD FindMulti (
              PHEAD WORD * term,
              WORD * pattern )
```

Definition at line 954 of file findpat.c.

4.39.2.4 FindRest()

```
int FindRest (
              PHEAD WORD * term,
              WORD * pattern )
```

Definition at line 1070 of file findpat.c.

00049
00050     The current version doesn't scan function arguments yet. 10-Apr-1988
00051
00052     This routine searches for an exact match. This means in particular:
00053     1:  x^# must match exactly.
00054     2:  x^n? must have a single value for n that cannot be adapted.
00055
00056     When setp != 0 it points to a collection of sets
00057     A match can occur only if no object will be left that belongs
00058     to any of these sets.

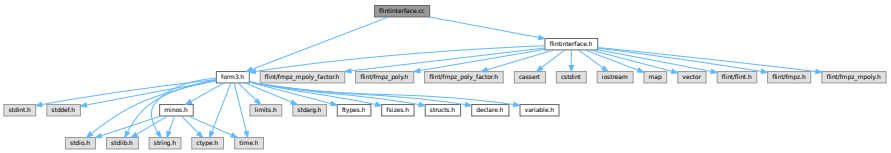
4.41 flintinterface.cc File Reference

```
#include "form3.h"
#include "flintinterface.h"
```

Include dependency graph for flintinterface.cc:



Macros

- #define UNIVARIATE_DENSITY_THR 0.02f
- #define IFW(x) { if (write) {x;} }

4.41.1 Detailed Description

Contains functions which interface with FLINT functions to perform arithmetic with uni- and multi-variate polynomials and perform factorization.

Definition in file flintinterface.cc.

4.41.2 Macro Definition Documentation

4.41.2.1 UNIVARIATE_DENSITY_THR

```
#define UNIVARIATE_DENSITY_THR 0.02f
```

Definition at line 71 of file flintinterface.cc.

4.41.2.2 IFW

```
#define IFW(
              x ) { if ( write ) {x;} }
```

Definition at line 1856 of file flintinterface.cc.

4.43.1 Detailed Description

Prototypes for functions in flintinterface.cc

Definition in file flintinterface.h.

4.43.2 Typedef Documentation

4.43.2.1 var_map_t

```
typedef std::map<uint32_t,uint32_t> flint::var_map_t
```

Definition at line 77 of file flintinterface.h.

4.43.3 Function Documentation

4.43.3.1 cleanup()

```
void flint::cleanup (
            void  )
```

Definition at line 76 of file flintinterface.cc.

4.43.3.2 cleanup_master()

```
void flint::cleanup_master (
            void  )
```

Definition at line 83 of file flintinterface.cc.

4.43.3.3 divmod_mpoly()

```
WORD * flint::divmod_mpoly (
            PHEAD const WORD * a,
            const WORD * b,
            const bool return_rem,
            const WORD must_fit_term,
            const var_map_t & var_map,
            const bool sort_vars )
```

Definition at line 91 of file flintinterface.cc.

4.43.3.4 divmod_poly()

```
WORD * flint::divmod_poly (
            PHEAD const WORD * a,
            const WORD * b,
            const bool return_rem,
            const WORD must_fit_term,
            const var_map_t & var_map )
```

Definition at line 165 of file flintinterface.cc.

4.43.3.5 factorize_mpoly()

```
WORD * flint::factorize_mpoly (
            PHEAD const WORD * argin,
            WORD * argout,
            const bool with_arghead,
            const bool is_fun_arg,
            const var_map_t & var_map,
            const bool sort_vars )
```

Definition at line 243 of file flintinterface.cc.

4.43.3.6 factorize_poly()

```
WORD * flint::factorize_poly (
            PHEAD const WORD * argin,
            WORD * argout,
            const bool with_arghead,
            const bool is_fun_arg,
            const var_map_t & var_map )
```

Definition at line 396 of file flintinterface.cc.

4.43.3.7 form_sort()

```
void flint::form_sort (
            PHEAD WORD * terms )
```

Definition at line 493 of file flintinterface.cc.

4.43.3.8 from_argument_mpoly()

```
uint64_t flint::from_argument_mpoly (
            fmpz_mpoly_t poly,
            fmpz_mpoly_t denpoly,
            const WORD * args,
            const bool with_arghead,
            const var_map_t & var_map,
            const fmpz_mpoly_ctx_t ctx )
```

Definition at line 550 of file flintinterface.cc.

4.43.3.9 from_argument_poly()

```
uint64_t flint::from_argument_poly (
            fmpz_poly_t poly,
            fmpz_poly_t denpoly,
            const WORD * args,
            const bool with_arghead )
```

Definition at line 696 of file flintinterface.cc.

4.43.3.10 fmpz_get_form()

```
WORD flint::fmpz_get_form (
            fmpz_t z,
            WORD * a )
```

Definition at line 826 of file flintinterface.cc.

4.43.3.11 fmpz_set_form()

```
void flint::fmpz_set_form (
            fmpz_t z,
            UWORD * a,
            WORD na )
```

Definition at line 891 of file flintinterface.cc.

4.43.3.12 gcd_mpoly()

```
WORD * flint::gcd_mpoly (
            PHEAD const WORD * a,
            const WORD * b,
            const WORD must_fit_term,
            const var_map_t & var_map,
            const bool sort_vars )
```

Definition at line 957 of file flintinterface.cc.

4.43.3.13 gcd_poly()

```
WORD * flint::gcd_poly (
            PHEAD const WORD * a,
            const WORD * b,
            const WORD must_fit_term,
            const var_map_t & var_map )
```

Definition at line 1061 of file flintinterface.cc.

4.43.3.14 get_variables()

```
flint::var_map_t flint::get_variables (
            const vector< WORD * > & es,
            const bool with_arghead,
            const bool sort_vars )
```

Definition at line 1151 of file flintinterface.cc.

4.43.3.15 inverse_poly()

```
WORD * flint::inverse_poly (
            PHEAD const WORD * a,
            const WORD * b,
            const var_map_t & var_map )
```

Definition at line 1273 of file flintinterface.cc.

4.43.3.16 mul_mpoly()

```
WORD * flint::mul_mpoly (
            PHEAD const WORD * a,
            const WORD * b,
            const var_map_t & var_map,
            const bool sort_vars )
```

Definition at line 1349 of file flintinterface.cc.

4.43.3.17 mul_poly()

```
WORD * flint::mul_poly (
            PHEAD const WORD * a,
            const WORD * b,
            const var_map_t & var_map )
```

Definition at line 1406 of file flintinterface.cc.

4.43.3.18 ratfun_add_mpoly()

```
void flint::ratfun_add_mpoly (
            PHEAD const WORD * t1,
            const WORD * t2,
            WORD * out,
            const var_map_t & var_map,
            const bool sort_vars )
```

Definition at line 1461 of file flintinterface.cc.

4.43.3.19 ratfun_add_poly()

```
void flint::ratfun_add_poly (
            PHEAD const WORD * t1,
            const WORD * t2,
            WORD * out,
            const var_map_t & var_map )
```

Definition at line 1513 of file flintinterface.cc.

4.43.3.20 ratfun_normalize_mpoly()

```
void flint::ratfun_normalize_mpoly (
            PHEAD WORD * term,
            const var_map_t & var_map,
            const bool sort_vars )
```

Definition at line 1566 of file flintinterface.cc.

4.43.3.21 ratfun_normalize_poly()

```
void flint::ratfun_normalize_poly (
            PHEAD WORD * term,
            const var_map_t & var_map )
```

Definition at line 1650 of file flintinterface.cc.

4.43.3.22 ratfun_read_mpoly()

```
void flint::ratfun_read_mpoly (
            const WORD * a,
            fmpz_mpoly_t num,
            fmpz_mpoly_t den,
            const var_map_t & var_map,
            fmpz_mpoly_ctx_t ctx )
```

Definition at line 1733 of file flintinterface.cc.

4.43.3.23 ratfun_read_poly()

```
void flint::ratfun_read_poly (
            const WORD * a,
            fmpz_poly_t num,
            fmpz_poly_t den )
```

Definition at line 1793 of file flintinterface.cc.

4.43.3.24 to_argument_mpoly() [1/2]

```
uint64_t flint::to_argument_mpoly (
            PHEAD WORD * out,
            const bool with_arghead,
            const bool must_fit_term,
            const bool write,
            const uint64_t prev_size,
            const fmpz_mpoly_t poly,
            const var_map_t & var_map,
            const fmpz_mpoly_ctx_t ctx,
            const bool sort_vars )
```

Definition at line 2057 of file flintinterface.cc.

4.43.3.25 to_argument_mpoly() [2/2]

```
uint64_t flint::to_argument_mpoly (
            PHEAD WORD * out,
            const bool with_arghead,
            const bool must_fit_term,
            const bool write,
            const uint64_t prev_size,
            const fmpz_mpoly_t poly,
            const var_map_t & var_map,
            const fmpz_mpoly_ctx_t ctx,
            const bool sort_vars,
            const fmpz_t denscale )
```

Definition at line 1857 of file flintinterface.cc.

4.43.3.26 to_argument_poly() [1/2]

```
uint64_t flint::to_argument_poly (
            PHEAD WORD * out,
            const bool with_arghead,
            const bool must_fit_term,
            const bool write,
            const uint64_t prev_size,
            const fmpz_poly_t poly,
            const var_map_t & var_map )
```

Definition at line 2249 of file flintinterface.cc.

4.43.3.27 to_argument_poly() [2/2]

```
uint64_t flint::to_argument_poly (
            PHEAD WORD * out,
            const bool with_arghead,
            const bool must_fit_term,
            const bool write,
            const uint64_t prev_size,
            const fmpz_poly_t poly,
            const var_map_t & var_map,
            const fmpz_t denscale )
```

Definition at line 2079 of file flintinterface.cc.

4.43.3.28 simplify_fmpz()

```
void flint::util::simplify_fmpz (
            fmpz_t num,
            fmpz_t den,
            fmpz_t gcd )  [inline]
```

Definition at line 2270 of file flintinterface.cc.

4.43.3.29 simplify_fmpz_poly()

```
void flint::util::simplify_fmpz_poly (
            fmpz_poly_t num,
            fmpz_poly_t den,
            fmpz_poly_t gcd )  [inline]
```

Definition at line 2282 of file flintinterface.cc.

4.43.3.30 fix_sign_fmpz_mpoly_ratfun()

```
void flint::util::fix_sign_fmpz_mpoly_ratfun (
            fmpz_mpoly_t num,
            fmpz_mpoly_t den,
            const fmpz_mpoly_ctx_t ctx )  [inline]
```

Definition at line 2299 of file flintinterface.cc.

4.43.3.31 fix_sign_fmpz_poly_ratfun()

```
void flint::util::fix_sign_fmpz_poly_ratfun (
             fmpz_poly_t num,
             fmpz_poly_t den )  [inline]
```

Definition at line 2311 of file flintinterface.cc.

4.45.1 Detailed Description

Contains functions to call FLINT interface from the rest of FORM.

Definition in file flintwrap.cc.

4.45.2 Function Documentation

4.45.2.1 flint_final_cleanup_thread()

```
void flint_final_cleanup_thread (
            void  )
```

Definition at line 43 of file flintwrap.cc.

4.45.2.2 flint_final_cleanup_master()

```
void flint_final_cleanup_master (
            void  )
```

Definition at line 50 of file flintwrap.cc.

4.45.2.3 flint_div()

```
WORD * flint_div (
            PHEAD WORD * a,
            WORD * b,
            const WORD must_fit_term )
```

Definition at line 57 of file flintwrap.cc.

4.45.2.4 flint_factorize_argument()

```
int flint_factorize_argument (
            PHEAD WORD * argin,
            WORD * argout )
```

Definition at line 79 of file flintwrap.cc.

4.45.2.5 flint_factorize_dollar()

```
WORD * flint_factorize_dollar (
            PHEAD WORD * argin )
```

Definition at line 100 of file flintwrap.cc.

4.45.2.6 flint_gcd()

```
WORD * flint_gcd (
            PHEAD WORD * a,
            WORD * b,
            const WORD must_fit_term )
```

Definition at line 119 of file flintwrap.cc.

4.45.2.7 flint_inverse()

```
WORD * flint_inverse (
            PHEAD WORD * a,
            WORD * b )
```

Definition at line 140 of file flintwrap.cc.

4.45.2.8 flint_mul()

```
WORD * flint_mul (
            PHEAD WORD * a,
            WORD * b )
```

Definition at line 161 of file flintwrap.cc.

4.45.2.9 flint_ratfun_add()

```
WORD * flint_ratfun_add (
            PHEAD WORD * t1,
            WORD * t2 )
```

Definition at line 182 of file flintwrap.cc.

4.45.2.10 flint_ratfun_normalize()

```
int flint_ratfun_normalize (
            PHEAD WORD * term )
```

Definition at line 223 of file flintwrap.cc.

4.45.2.11 flint_rem()

```
WORD * flint_rem (
            PHEAD WORD * a,
            WORD * b,
            const WORD must_fit_term )
```

Definition at line 296 of file flintwrap.cc.

4.45.2.12 flint_check_version()

```
void flint_check_version (
             void  )
```

Checks the FLINT library version at runtime.

This function should be called at startup. The program will terminate if a known buggy version of FLINT is detected.

Definition at line 325 of file flintwrap.cc.

4.47.1 Detailed Description

This file contains numerical routines that deal with floating point numbers. We use the GMP for arbitrary precision floating point arithmetic. The functions of the type sin, cos, ln, sqrt etc are handled by the mpfr library. The reason that for MZV's and the general notation we use the GMP (mpf_) is because the contents of the structs have been frozen and can be used for storage in a Form function float_. With mpfr_ this is not safely possible. All mpfr_ related code is in the file evaluate.c.

4.47.2 Macro Definition Documentation

4.47.2.1 WITHCUTOFF

```
#define WITHCUTOFF
```

Definition at line 45 of file float.c.

4.47.2.2 GMPSPREAD

```
#define GMPSPREAD (GMP_LIMB_BITS/BITSINWORD)
```

Definition at line 47 of file float.c.

4.47.3 Function Documentation

4.47.3.1 Form_mpf_init()

```
void Form_mpf_init (
            mpf_t t )
```

Definition at line 177 of file float.c.

4.47.3.2 Form_mpf_clear()

```
void Form_mpf_clear (
            mpf_t t )
```

Definition at line 201 of file float.c.

4.47.3.3 Form_mpf_set_prec_raw()

```
void Form_mpf_set_prec_raw (
            mpf_t t,
            ULONG newprec )
```

Definition at line 227 of file float.c.

4.47.3.4 FormtoZ()

```
void FormtoZ (
            mpz_t z,
            UWORD * a,
            WORD na )
```

Definition at line 515 of file float.c.

4.47.3.5 ZtoForm()

```
void ZtoForm (
            UWORD * a,
            WORD * na,
            mpz_t z )
```

Definition at line 559 of file float.c.

4.47.3.6 FloatToInteger()

```
long FloatToInteger (
            UWORD * out,
            mpf_t floatin,
            long * bitsused )
```

Definition at line 585 of file float.c.

4.47.3.7 IntegerToFloat()

```
void IntegerToFloat (
            mpf_t result,
            UWORD * formlong,
            int longsize )
```

Definition at line 608 of file float.c.

4.47.3.8 FloatToRat()

```
int FloatToRat (
            UWORD * ratout,
            WORD * nratout,
            mpf_t floatin )
```

Definition at line 672 of file float.c.

4.47.3.9 AddFloats()

```
int AddFloats (
            PHEAD WORD * fun3,
            WORD * fun1,
            WORD * fun2 )
```

Definition at line 995 of file float.c.

4.47.3.10 MulFloats()

```
int MulFloats (
            PHEAD WORD * fun3,
            WORD * fun1,
            WORD * fun2 )
```

Definition at line 1011 of file float.c.

4.47.3.11 DivFloats()

```
int DivFloats (
              PHEAD WORD * fun3,
              WORD * fun1,
              WORD * fun2 )
```

Definition at line 1027 of file float.c.

4.47.3.12 AddRatToFloat()

```
int AddRatToFloat (
              PHEAD WORD * outfun,
              WORD * infun,
              UWORD * formrat,
              WORD nrat )
```

Definition at line 1045 of file float.c.

4.47.3.13 MulRatToFloat()

```
int MulRatToFloat (
              PHEAD WORD * outfun,
              WORD * infun,
              UWORD * formrat,
              WORD nrat )
```

Definition at line 1064 of file float.c.

4.47.3.14 SimpleDelta()

```
void SimpleDelta (
              mpf_t sum,
              int m )
```

Definition at line 1885 of file float.c.

4.47.3.15 SimpleDeltaC()

```
void SimpleDeltaC (
              mpf_t sum,
              int m )
```

Definition at line 1944 of file float.c.

4.47.3.16 SingleTable()

```
void SingleTable (
            mpf_t * tabl,
            int N,
            int m,
            int pow )
```

Definition at line 2003 of file float.c.

4.47.3.17 DoubleTable()

```
void DoubleTable (
            mpf_t * tabout,
            mpf_t * tabin,
            int N,
            int m,
            int pow )
```

Definition at line 2059 of file float.c.

4.47.3.18 EndTable()

```
void EndTable (
            mpf_t sum,
            mpf_t * tabin,
            int N,
            int m,
            int pow )
```

Definition at line 2114 of file float.c.

4.47.3.19 deltaMZV()

```
void deltaMZV (
            mpf_t result,
            WORD * indexes,
            int depth )
```

Definition at line 2163 of file float.c.

4.47.3.20 deltaEuler()

```
void deltaEuler (
            mpf_t result,
            WORD * indexes,
            int depth )
```

Definition at line 2230 of file float.c.

4.47.3.21 deltaEulerC()

```
void deltaEulerC (
            mpf_t result,
            WORD * indexes,
            int depth )
```

Definition at line 2286 of file float.c.

4.47.3.22 CalculateMZVhalf()

```
void CalculateMZVhalf (
            mpf_t result,
            WORD * indexes,
            int depth )
```

Definition at line 2362 of file float.c.

4.47.3.23 CalculateMZV()

```
void CalculateMZV (
            mpf_t result,
            WORD * indexes,
            int depth )
```

Definition at line 2387 of file float.c.

4.47.3.24 CalculateEuler()

```
void CalculateEuler (
            mpf_t result,
            WORD * Zindexes,
            int depth )
```

Definition at line 2458 of file float.c.

4.47.3.25 ExpandMZV()

```
int ExpandMZV (
            WORD * term,
            WORD level )
```

Definition at line 2540 of file float.c.

4.47.3.26 ExpandEuler()

```
int ExpandEuler (
            WORD * term,
            WORD level )
```

Definition at line 2552 of file float.c.

4.47.3.27 PackFloat()

```
int PackFloat (
            WORD * fun,
            mpf_t infloat )
```

Definition at line 271 of file float.c.

4.47.3.28 UnpackFloat()

```
int UnpackFloat (
            mpf_t outfloat,
            WORD * fun )
```

Definition at line 366 of file float.c.

4.47.3.29 RatToFloat()

```
void RatToFloat (
            mpf_t result,
            UWORD * formrat,
            int ratsize )
```

Definition at line 624 of file float.c.

4.47.3.30 Form_mpf_empty()

```
void Form_mpf_empty (
            mpf_t t )
```

Definition at line 214 of file float.c.

4.47.3.31 TestFloat()

```
int TestFloat (
            WORD * fun )
```

Definition at line 456 of file float.c.

4.47.3.32 FloatFunToRat()

```
WORD FloatFunToRat (
            PHEAD UWORD * ratout,
            WORD * in )
```

Definition at line 646 of file float.c.

4.47.3.33 ZeroTable()

```
void ZeroTable (
            mpf_t * tab,
            int N )
```

Definition at line 813 of file float.c.

00079
00080 /*
00081     #] Includes :
00082     #[ Some GMP float info :
00083
00084     From gmp.h:
00085
00086     typedef struct
00087     {
00088       int _mp_prec;     Max precision, in number of `mp_limb_t's.
00089                         Set by mpf_init and modified by
00090                         mpf_set_prec.  The area pointed to by the
00091                         _mp_d field contains `prec' + 1 limbs.
00092       int _mp_size;     abs(_mp_size) is the number of limbs the
00093                         last field points to.  If _mp_size is
00094                         negative this is a negative number.
00095       mp_exp_t _mp_exp; Exponent, in the base of `mp_limb_t'.
00096       mp_limb_t *_mp_d; Pointer to the limbs.
00097     } __mpf_struct;
00098
00099     typedef __mpf_struct mpf_t[1];
00100
00101     Currently:
00102         sizeof(int) = 4
00103         sizeof(mpf_t) = 24
00104         sizeof(mp_limb_t) = 8,
00105         sizeof(mp_exp_t) = 8,
00106         sizeof a pointer is 8.
00107     If any of this changes in the future we would have to change the
00108     PackFloat and UnpackFloat routines.
00109
00110     Our float_ function is packed with the 4 arguments:
00111         -SNUMBER _mp_prec
00112         -SNUMBER _mp_size
00113         exponent which can be -SNUMBER or a regular term
00114         the limbs as n/1 in regular term format, or just an -SNUMBER.
00115     During normalization the sign is taken away from the second argument
00116     and put as the sign of the complete term. This is easier for the
00117     WriteInnerTerm routine in sch.c
00118
00119     Wildcarding of functions excludes matches with float_
00120     Float_ always ends up inside the bracket, just like poly(rat)fun.
00121
00122     From mpfr.h
00123
00124     The formats here are different. This has, among others, to do with
00125     the rounding. The result is that we need different aux variables
00126     when working with mpfr and we need a different conversion routine
00127     to float. It also means that we need to treat the mzv_ etc functions
00128     completely separately. For now we try to develop that in the file
00129     Evaluate.c. At a later stage we may merge the two files.
00130     Originally we had the sqrt in float.c but it seems better to put
00131     it in Evaluate.c
00132
00133     #] Some GMP float info :
00134     #[ Low Level :
00135
00136         In the low level routines we interact directly with the content
00137         of the GMP structs. This can be done safely, because their
00138         layout is documented. We pay particular attention to the init
00139         and clear routines, because they involve malloc/free calls.
00140
00141         #[ Explanations :
00142
00143     We need a number of facilities inside Form to deal with floating point
00144     numbers, taking into account that they are only meant for sporadic use.
00145     1: We need a special function float_ who's arguments contain a limb
00146        representation of the mpf_t of the gmp.
00147     2: Some functions may return a floating point number. This is then in
00148        the form of an occurrence of the function float_.
00149     3: We need a print routine to print this float_.
00150     4: We need routines for conversions:
00151         a: (long) int to float.
00152         b: rat to float.
00153         c: float to rat (if possible)
00154         d: float to integer (with rounding toward zero).
00155     5: We need calculational operations for add, sub, mul, div, exp.
00156     6: We need service routines to pack and unpack the function float_.
00157     7: The coefficient should be pulled inside float_.
00158     8: Float_ cannot occur inside PolyRatFun.
00159     9: We need to be able to treat float_ as the coefficient during sorting.
00160     10: For now, we need the functions mzvf_ and eulerf_ for the evaluation
00161         of mzv's and euler sums.
00162     11: We need a setting for the default precision.
00163     12: We need a special flag for the dirty field of arguments to avoid
00164         the normalization of the argument with the limbs.
```

```
00165         Alternatively, the float_ should be not a regular function, but
00166         get a status < FUNCTION. Just like SNUMBER, LNUMBER etc.
00167
00168     Note that we can keep this thread-safe. The only routine that is not
00169     thread-safe is the print routine, but that is in accordance with all
00170     other print routines in Form. When called from MesPrint it needs to
00171     be protected by a lock, as is done standard inside Form.
00172

```

```
00252         #] Form_mpf_set_prec_raw :
00253         #[ PackFloat :
00254
00255     Puts an object of type mpf_t inside a function float_
00256     float_(prec, nlimbs, exp, limbs);
00257     Complication: the limbs and the exponent are long's. That means
00258     two times the size of a Form (U)WORD.
00259     To save space we could split the limbs in two because Form stores
00260     coefficients as rationals with equal space for numerator and denominator.
00261     Hence for each limb we could put the most significant UWORD in the
00262     numerator and the least significant limb in the denominator.
00263     This gives a problem with the compilation and subsequent potential
00264     normalization of the 'fraction'. Hence for now we take the wasteful
00265     approach. At a later stage we can try to veto normalization of FLOATFUN.
00266     Caution: gmp/fmp is little endian and Form is big endian.
00267
00268     Zero is represented by zero limbs (and zero exponent).

01611 /*
01612         #] Chop :
01613     #] Float Routines :
01614     #[ Sorting :
01615 
01616         We need a method to see whether two terms need addition that could
01617         involve floating point numbers.
01618         1: if PolyWise is active, we do not need anything, because
01619            Poly(Rat)Fun and floating point are mutually exclusive.
01620         2: This means that there should be only interference in AddCoef.
01621            and the AddRat parts in MergePatches, MasterMerge, SortBotMerge
01622            and PF_GetLoser.
01623         The compare routine(s) should recognise the float_ and give off
01624         a code (SortFloatMode) inside the AT struct:
01625         0: no float_
01626         1: float_ in term1 only
01627         2: float_ in term2 only
01628         3: float_ in both terms
01629         Be careful: we have several compare routines, because various codes
01630         use their own routines and we just set a variable with its address.
01631         Currently we have Compare1, CompareSymbols and CompareHSymbols.
01632         Only Compare1 should be active for this. The others should make sure
01633         that the proper variable is always zero.
01634         Remember: the sign of the coefficient is in the last word of the term.
01635 
01636         We need two routines:
01637         1: AddWithFloat for SplitMerge which sorts by pointer.
01638         2: MergeWithFloat for MergePatches etc which keeps terms as much
01639            as possible in their location.
01640         The routines start out the same, because AT.SortFloatMode, set in
01641         Compare1, tells more or less what should be done.
```

```
01642         The difference is in where we leave the result.
01643
01644         In the future we may want to add a feature that makes the result
01645         zero if the sum comes within a certain distance of the numerical
01646         accuracy, like for instance 5% of the number of bits.

01870     #] Sorting :
01871     #[ MZV :
01872
01873         The functions here allow the arbitrary precision calculation
01874         of MZV's and Euler sums.
01875         They are called when the functions mzv_ and/or euler_ are used
01876         and the evaluate statement is applied.
01877         The output is in a float_ function.
01878         The expand statement tries to express the functions in terms of a basis.
01879         The bases are the 'standard basis for the euler sums and the
01880         pushdown bases from the datamine, unless otherwise specified.

02439
02440         There is a problem of notation here.
02441         Basically there are two notations.
02442         1: Z(m1,m2,m3) = sum_(j3,1,inf,sign_(m3)/j3^abs_(m3)*
02443                          sum_(j2,j3+1,inf,sign_(m2)/j2^abs_(m2)*
02444                          sum_(j1,j2+1,inf,sign_(m1)/j1^abs_(m1))))
02445            See Broadhurst,1996
02446         2: L(m1,m2,m3) = sum_(j1,1,inf,sign_(m1)*
02447                          sum_(j2,1,inf,sign_(m2)*
02448                          sum_(j3,1,inf,sign_(m3)
02449                             /j3^abs_(m3)
02450                             /(j2+j3)^abs_(m2)
02451                             /(j1+j2+j3)^abs_(m1) )))
02452            See Borwein, Bradley, Broadhurst and Lisonek, 1999
02453         The L corresponds with the H of the datamine up to sign_(m1*m2*m3)
02454         The algorithm follows 2, but the more common notation is 1.
02455         Hence we start with a conversion.

02561         #[ EvaluateEuler :
02562
02563     There are various steps here:
02564     1: locate an Euler function.
02565     2: evaluate it into a float.
02566     3: convert the coefficient to a float and multiply.
02567     4: Put the new term together.
02568     5: Restart to see whether there are more Euler functions.
02569     The compiler should check that there is no conflict between
02570     the evaluate command and a potential polyfun or polyratfun.
02571     Yet, when reading in expressions there can be a conflict.
02572     Hence the Normalize routine should check as well.
02573

4.51.1 Detailed Description

The definition the default values for certain buffer sizes etc.

Definition in file fsizes.h.

4.51.2 Macro Definition Documentation

4.51.2.1 MAXPRENAMESIZE

```
#define MAXPRENAMESIZE 128
```

Definition at line 36 of file fsizes.h.

4.51.2.2 MAXENAME

```
#define MAXENAME 16
```

Definition at line 73 of file fsizes.h.

4.51.2.3 MAXSAVEFUNCTION

```
#define MAXSAVEFUNCTION 16384
```

Definition at line 74 of file fsizes.h.

4.51.2.4 MAXPARLEVEL

```
#define MAXPARLEVEL 100
```

Definition at line 76 of file fsizes.h.

4.51.2.5 MAXNUMBERSIZE

```
#define MAXNUMBERSIZE 200
```

Definition at line 77 of file fsizes.h.

4.51.2.6 MAXREPEAT

```
#define MAXREPEAT 100
```

Definition at line 79 of file fsizes.h.

4.51.2.7 NORMSIZE

```
#define NORMSIZE 1000
```

Definition at line 80 of file fsizes.h.

4.51.2.8 INITNODESIZE

```
#define INITNODESIZE 10
```

Definition at line 82 of file fsizes.h.

4.51.2.9 INITNAMESIZE

```
#define INITNAMESIZE 100
```

Definition at line 83 of file fsizes.h.

4.51.2.10 NUMFIXED

```
#define NUMFIXED 128
```

Definition at line 85 of file fsizes.h.

4.51.2.11 MAXNEST

```
#define MAXNEST 100
```

Definition at line 86 of file fsizes.h.

4.51.2.12 MAXMATCH

```
#define MAXMATCH 30
```

Definition at line 87 of file fsizes.h.

4.51.2.13 MAXIF

```
#define MAXIF 20
```

Definition at line 88 of file fsizes.h.

4.51.2.14 SIZEFACS

```
#define SIZEFACS 640L
```

Definition at line 89 of file fsizes.h.

4.51.2.15 NUMFACS

```
#define NUMFACS 50
```

Definition at line 90 of file fsizes.h.

4.51.2.16 MAXLOOPS

```
#define MAXLOOPS 30
```

Definition at line 91 of file fsizes.h.

4.51.2.17 MAXLABELS

```
#define MAXLABELS 20
```

Definition at line 92 of file fsizes.h.

4.51.2.18 COMMERCIALSIZE

```
#define COMMERCIALSIZE 24
```

Definition at line 93 of file fsizes.h.

4.51.2.19 MAXFLAGS

```
#define MAXFLAGS 16
```

Definition at line 94 of file fsizes.h.

4.51.2.20 COMPRESSBUFFER

```
#define COMPRESSBUFFER 90000
```

Definition at line 99 of file fsizes.h.

4.51.2.21 FORTRANCONTINUATIONLINES

```
#define FORTRANCONTINUATIONLINES 15
```

Definition at line 100 of file fsizes.h.

4.51.2.22 MAXLEVELS

```
#define MAXLEVELS 2000
```

Definition at line 101 of file fsizes.h.

4.51.2.23 MAXLHS

```
#define MAXLHS 400
```

Definition at line 102 of file fsizes.h.

4.51.2.24 MAXWILDC

```
#define MAXWILDC 100
```

Definition at line 103 of file fsizes.h.

4.51.2.25 NUMTABLEENTRIES

```
#define NUMTABLEENTRIES 1000
```

Definition at line 104 of file fsizes.h.

4.51.2.26 COMPILERBUFFER

```
#define COMPILERBUFFER 20000
```

Definition at line 105 of file fsizes.h.

4.51.2.27 MAXPATCHES

```
#define MAXPATCHES 256
```

Definition at line 131 of file fsizes.h.

4.51.2.28 MAXFPATCHES

```
#define MAXFPATCHES 256
```

Definition at line 132 of file fsizes.h.

4.51.2.29 SORTIOSIZE

```
#define SORTIOSIZE 200000L
```

Definition at line 133 of file fsizes.h.

4.51.2.30 SSMALLBUFFER

```
#define SSMALLBUFFER 2560016L
```

Definition at line 135 of file fsizes.h.

4.51.2.31 SSMALLOVERFLOW

```
#define SSMALLOVERFLOW 3840032L
```

Definition at line 136 of file fsizes.h.

4.53.1 Detailed Description

Contains the definitions of many internal codes Rather than using numbers directly we do this by defines, making it much easier to change things. Changing things is sometimes also a good way of testing the code.

Definition in file ftypes.h.

4.53.2 Macro Definition Documentation

4.53.2.1 WITHOUTERROR

```
#define WITHOUTERROR 0
```

The next macros were introduced when TFORM was programmed. In the case of workers, each worker may need some private data. These can in principle be accessed by some posix calls but that is unnecessarily slow. The passing of a pointer to the complete data struct with private data will be much faster. And anyway, there would have to be a macro that either makes the posix call (TFORM) or doesn't (FORM). The solution by having macro's that either pass the pointer (TFORM) or don't pass it (FORM) is seen as the best solution.

In the declarations and the calling of the functions we have to use the PHEAD or the BHEAD macro, respectively, if the pointer is to be passed. These macro's contain the comma as well. Hence we need special macro's if there are no other arguments. These are called PHEAD0 and BHEAD0.

4.55.1 Detailed Description

The file with the central routines for the pattern matching of functions and their arguments. The file also contains the routines for the execution of the Symmetrize statement and its variations (like antisymmetrize etc).

Definition in file function.c.

4.55.2 Function Documentation

4.55.2.1 MakeDirty()

```
int MakeDirty (
            WORD * term,
            WORD * x,
            WORD par )
```

Definition at line 51 of file function.c.

4.55.2.2 MarkDirty()

```
void MarkDirty (
            WORD * term,
            WORD flags )
```

Definition at line 97 of file function.c.

4.55.2.3 PolyFunDirty()

```
void PolyFunDirty (
            PHEAD WORD * term )
```

Definition at line 139 of file function.c.

4.55.2.4 PolyFunClean()

```
void PolyFunClean (
            PHEAD WORD * term )
```

Definition at line 174 of file function.c.

4.55.2.5 Symmetrize()

```
WORD Symmetrize (
            PHEAD WORD * func,
            WORD * Lijst,
            WORD ngroups,
            WORD gsize,
            WORD type )
```

Definition at line 213 of file function.c.

4.55.2.6 CompGroup()

```
int CompGroup (
             PHEAD WORD type,
             WORD ** args,
             WORD * a1,
             WORD * a2,
             WORD num )
```

Definition at line 373 of file function.c.

4.55.2.7 FullSymmetrize()

```
int FullSymmetrize (
             PHEAD WORD * fun,
             int type )
```

Definition at line 473 of file function.c.

4.55.2.8 SymGen()

```
int SymGen (
             PHEAD WORD * term,
             WORD * params,
             WORD num,
             WORD level )
```

Definition at line 518 of file function.c.

4.55.2.9 SymFind()

```
int SymFind (
             PHEAD WORD * term,
             WORD * params )
```

Definition at line 633 of file function.c.

4.55.2.10 ChainIn()

```
int ChainIn (
             PHEAD WORD * term,
             WORD funnum )
```

Definition at line 691 of file function.c.

4.55.2.11 ChainOut()

```
int ChainOut (
             PHEAD WORD * term,
             WORD funnum )
```

Definition at line 748 of file function.c.

4.55.2.12 MatchFunction()

```
int MatchFunction (
              PHEAD WORD * pattern,
              WORD * interm,
              WORD * wilds )
```

Definition at line 826 of file function.c.

4.55.2.13 ScanFunctions()

```
int ScanFunctions (
              PHEAD WORD * inpat,
              WORD * inter,
              WORD par )
```

Definition at line 1618 of file function.c.

00802         #] ChainOut :
00803     #] Utilities :
00804     #[ Patterns :
00805         #[ MatchFunction :          WORD MatchFunction(pattern,interm,wilds)
00806
00807         The routine assumes that the function numbers are the same.
00808         The contents are compared and a possible wildcard assignment
00809         is made. Note that it may be necessary to use a wildcard
00810         assignment stack to do things right.
00811         The routine can become arbitrarily complicated as there is
00812         no end to the possible wildcarding.
00813         Examples:
00814         -   a:  No wildcarding -> straight match
00815         -   b:  Individual arguments (object -> object)
00816         -   c:  whole arguments (object to subexpression)
00817         -   d:  any argumentlist
00818             e:  part of an argument (object inside subexpression)
00819
00820         The ones with a minus sign in front have been implemented.
00821
00822         Note: the argument wilds allows backtracking when multiple
00823         ?a,?b give a match that later turns out to be useless.

01576         #[ ScanFunctions :          WORD ScanFunctions(inpat,inter,par)
01577
01578         Finds in which functions to look for a match.
01579         inpat is the start of the pattern still to be matched.
01580         inter is the start of the term still to be matched.
01581         par gives information about commutativity.
01582             par = 0: nothing special
01583             par = 1: regular noncommuting function
01584             par = 2: GAMMA function
01585
01586         AN.patstop: end of the functions field in the search pattern
01587         AN.terstop: end of the functions field in the target pattern
01588         AN.terstart: address of entire term;
01589
01590         The actual matching of the functions and their arguments is done
01591         in a number of different routines. Mainly MatchFunction when there
01592         are no symmetry properties.
01593         Also: MatchE
01594               MatchCy
01595               FunMatchSy
01596               FunMatchCy
01597
01598         The main problem here is backtracking, ie continuing with wildcard
01599         possibilities when a first assignment doesn't work.
01600         Important note: this was completely forgotten in the symmetric
01601         functions till 6-jan-2009. As of the moment this still has to
01602         be fixed.  ???????21-mar-2023????? Is this still unfixed?????
01603
01604         Functions inside functions can cause problems when antisymmetric
01605         functions are involved. The sign of the term may be at stake.
01606         At the lowest level this is no problem but in f(-fas(n2,n1)) this
01607         plays a role. Next is when we have a product of functions inside
01608         an argument. The strategy must be that we test the sign only at the
01609         last function. Hence, when inpat+inpat[1] >= AN.patstop.
01610         We might relax that to the last antisymmetric function at a later stage.
01611
01612     New scheme to be implemented for non-commuting objects:
01613     When we are matching a second (or higher) function, any match can only
01614     be directly after the last matched non-commuting function or a commuting
01615     function. This will take care of whatever happens in MatchE etc.
01616 */

4.62.1 Detailed Description

Routines for the dealing with if statements.

Definition in file if.c.

4.62.2 Function Documentation

4.62.2.1 GetIfDollarNum()

```
WORD GetIfDollarNum (
            WORD * ifp,
            WORD * ifstop )
```

Definition at line 106 of file if.c.

4.62.2.2 FindVar()

```
int FindVar (
            WORD * v,
            WORD * term )
```

Definition at line 173 of file if.c.

4.62.2.3 DoIfStatement()

```
int DoIfStatement (
            PHEAD WORD * ifcode,
            WORD * term )
```

Definition at line 280 of file if.c.

4.62.2.4 HowMany()

```
WORD HowMany (
            PHEAD WORD * ifcode,
            WORD * term )
```

Definition at line 856 of file if.c.

4.62.2.5 DoubleIfBuffers()

```
void DoubleIfBuffers (
            void  )
```

Definition at line 1049 of file if.c.

4.62.2.6 DoSwitch()

```
int DoSwitch (
            PHEAD WORD * term,
            WORD * lhs )
```

Definition at line 1086 of file if.c.

4.62.2.7 DoEndSwitch()

```
int DoEndSwitch (
            PHEAD WORD * term,
            WORD * lhs )
```

Definition at line 1102 of file if.c.

4.62.2.8 FindCase()

```
SWITCHTABLE * FindCase (
            WORD nswitch,
            WORD ncase )
```

Definition at line 1113 of file if.c.

4.62.2.9 DoubleSwitchBuffers()

```
int DoubleSwitchBuffers (
            void  )
```

Definition at line 1151 of file if.c.

4.62.2.10 SwitchSplitMergeRec()

```
void SwitchSplitMergeRec (
            SWITCHTABLE * array,
            WORD num,
            SWITCHTABLE * auxarray )
```

Definition at line 1200 of file if.c.

4.62.2.11 SwitchSplitMerge()

```
void SwitchSplitMerge (
            SWITCHTABLE * array,
            WORD num )
```

Definition at line 1229 of file if.c.

00039     #[ If statement :
00040         #[ Syntax :
```

```
00041
00042         The `if' is a conglomerate of statements: if,else,endif
00043
00044         The if consists in principle of:
00045
00046         if ( number );
00047             statements
00048         else;
00049             statements
00050         endif;
00051
00052         The first set is taken when number != 0.
00053         The else is not mandatory.
00054         TRUE = 1 and FALSE = 0
00055
00056         The number can be built up via a logical expression:
00057
00058                     expr1 condition expr2
00059
00060         each expression can be a subexpression again. It has to be
00061         enclosed in parentheses in that case.
00062         Conditions are:
00063             >, >=, <, <=, ==, !=, ||, &&
00064
00065         When Expressions are chained evaluation is from left to right,
00066         independent of whether this indicates nonsense.
00067         if ( a || b || c || d ); is a perfectly normal statement.
00068         if ( a >= b || c == d ); would be messed up. This should be:
00069         if ( ( a >= b ) || ( c == d ) );
00070
00071         The building blocks of the Expressions are:
00072
00073             Match(option,pattern)   The number of times pattern fits in term_
00074             Count(....)             The count value of term_
00075             Coeff[icient]           The coefficient of term_
00076             FindLoop(options)       Are there loops (as in ReplaceLoop).
00077
00078         Implementation for internal notation:
00079
00080         TYPEIF,length,gotolevel(if fail),EXPRTYPE,length,......
00081
00082         EXPRTYPE can be:
00083             SHORTNUMBER         ->,4,sign,size
00084             LONGNUMBER          ->,|ncoef+2|,ncoef,numer,denom
00085             MATCH               ->,patternsiz+3,keyword,pattern
00086             MULTIPLEOF          ->,3,thenumber
00087             COUNT               ->,countsiz+2,countinfo
00088             TYPEFINDLOOP        ->,7 (findloop info)
00089             COEFFICIENT         ->,2
00090             IFDOLLAR            ->,3,dollarnumber
00091             SUBEXPR             ->,size,dummy,size1,EXPRTYPE,length,...
00092                                   ,2,condition1,size2,...
00093                                 This is like functions.
00094
00095         Note that there must be a restriction to the number of nestings
00096         of parentheses in an if statement. It has been set to 10.
00097
00098         The syntax of match corresponds to the syntax of the left side
00099         of an id statement. The only difference is the keyword
00100         MATCH vs TYPEIDNEW.

4.64.1 Detailed Description

The routines that deal with bracket indexing It creates the bracket index and it can find the brackets using the index.

Definition in file index.c.

4.64.2 Function Documentation

4.64.2.1 FindBracket()

```
POSITION * FindBracket (
            WORD nexp,
            WORD * bracket )
```

Definition at line 65 of file index.c.

4.64.2.2 PutBracketInIndex()

```
void PutBracketInIndex (
            PHEAD WORD * term,
            POSITION * newpos )
```

Definition at line 331 of file index.c.

4.64.2.3 ClearBracketIndex()

```
void ClearBracketIndex (
            WORD numexp )
```

Definition at line 548 of file index.c.

4.64.2.4 OpenBracketIndex()

```
void OpenBracketIndex (
            WORD nexpr )
```

Definition at line 580 of file index.c.

4.64.2.5 PutInside()

```
int PutInside (
            PHEAD WORD * term,
            WORD * code )
```

Definition at line 611 of file index.c.

00044
00045     The indexing of brackets is not automatic! It should only be used
00046     when one intends to use the contents of individual brackets.
```

```
00047     This is done with the addition of a + sign to the bracket statement:
00048     B+ a,b,c; or AB+ a,b,c;
00049     It does require resources! The index is kept in memory and is removed
00050     once the expression is treated and passed on to the output with different
00051     or no brackets.
00052     The index is limited to a given amount of space. Hence if there are too
00053     many brackets we will skip some in the index. Skipping goes by space
00054     occupied by the contents. We take the two adjacent bracket(s) with the
00055     least space together and represent them by the first one only. This gives
00056     a new spot.
00057     The expression struct has two pointers:
00058     bracketinfo      for using.
00059     newbracketinfo   for making new index.

- char * setupfilename = "form.set"

4.66.1 Detailed Description

Contains the initialization of a number of structs at compile time This file should only be included in the file startup.c !!!

Definition in file inivar.h.

4.66.2 Variable Documentation

4.66.2.1 FG

```
FIXEDGLOBALS FG
```

Definition at line 34 of file inivar.h.

4.66.2.2 A

```
ALLGLOBALS A
```

Definition at line 133 of file inivar.h.

4.66.2.3 fixedsets

```
FIXEDSET fixedsets[]
```

Initial value:

```
= {
     {"pos_",    "integers > 0",  CSYMBOL, 0}
    ,{"pos0_",   "integers >= 0", CSYMBOL, 0}
    ,{"neg_",    "integers < 0",  CSYMBOL, 0}
    ,{"neg0_",   "integers <= 0", CSYMBOL, 0}
    ,{"even_",   "even integers", CSYMBOL, 0}
    ,{"odd_",    "odd integers",  CSYMBOL, 0}
    ,{"int_",    "all integers",  CSYMBOL, 0}
    ,{"symbol_","only symbols",  CSYMBOL, MAXPOSITIVE}
    ,{"fixed_", "fixed indices", CINDEX, 0}
    ,{"index_", "all indices",    CINDEX, 0}
    ,{"number_","all rationals", CSYMBOL, 0}
    ,{"dummyindices_", "dummy indices", CINDEX, 0}
    ,{"vector_","only vectors",  CVECTOR, 0}
}
```

Definition at line 259 of file inivar.h.

4.66.2.4 BufferForOutput

```
UBYTE BufferForOutput[MAXLINELENGTH+14]
```

Definition at line 275 of file inivar.h.

4.66.2.5 setupfilename

```
char* setupfilename = "form.set"
```

Definition at line 277 of file inivar.h.

4.67 inivar.h

4.68.1 Detailed Description

Routines to find loops in index contractions. These routines allow for a category of topological statements. They were originally developed for the color library.

Definition in file lus.c.

4.68.2 Function Documentation

4.68.2.1 Lus()

```
int Lus (
            WORD * term,
            WORD funnum,
            WORD loopsize,
            WORD numargs,
            WORD outfun,
            WORD mode )
```

Definition at line 57 of file lus.c.

4.68.2.2 FindLus()

```
int FindLus (
            int from,
            int level,
            int openindex )
```

Definition at line 515 of file lus.c.

4.68.2.3 SortTheList()

```
int SortTheList (
            int * slist,
            int num )
```

Definition at line 578 of file lus.c.

4.68.2.4 AllLoops()

```
int AllLoops (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 650 of file lus.c.

4.68.2.5 StartLoops()

```
LONG StartLoops (
            PHEAD WORD * term,
            WORD level,
            LONG vert,
            WORD nvert,
            WORD * arglist,
            WORD nargs,
            WORD * loop,
            WORD nloop )
```

Definition at line 894 of file lus.c.

4.68.2.6 GenLoops()

```
LONG GenLoops (
            PHEAD WORD * term,
            WORD level,
            LONG vert,
            WORD nvert,
            WORD * arglist,
            WORD nargs,
            WORD * loop,
            WORD nloop )
```

Definition at line 982 of file lus.c.

4.68.2.7 LoopOutput()

```
void LoopOutput (
            PHEAD WORD * term,
            WORD level,
            WORD * loop,
            WORD nloop )
```

Definition at line 1061 of file lus.c.

4.68.2.8 AllPaths()

```
int AllPaths (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 1125 of file lus.c.

4.68.2.9 GenPaths()

```
LONG GenPaths (
             PHEAD WORD * term,
             WORD level,
             LONG vert,
             WORD nvert,
             WORD * arglist,
             WORD nargs,
             WORD * path,
             WORD npath )
```

Definition at line 1415 of file lus.c.

4.68.2.10 PathOutput()

```
void PathOutput (
             PHEAD WORD * term,
             WORD level,
             WORD * path,
             WORD npath )
```

Definition at line 1488 of file lus.c.

4.68.2.11 AllOnePI()

```
WORD AllOnePI (
             WORD * term,
             WORD level )
```

Definition at line 1568 of file lus.c.

4.68.2.12 RemoveBridges()

```
int RemoveBridges (
             void  )
```

Definition at line 1588 of file lus.c.

4.68.2.13 TakeOneLine()

```
int TakeOneLine (
             WORD * term,
             WORD level )
```

Definition at line 1598 of file lus.c.

4.68.2.14 OutputOnePI()

```
int OutputOnePI (
            PHEAD WORD * term,
            WORD level )
```

Definition at line 1610 of file lus.c.

00624     #] SortTheList :
00625     #[ AllLoops :
00626
00627     Routine finds all possible loops that can be made in the
00628     arguments of the symmetric commuting vertex function v and creates
00629     for each loop a new term which is the original term times the loop.
00630     The occurrences of v can have different numbers of arguments.
00631     Each argument that occurs twice (and in different instances of v)
00632     in total will be considered.
00633
00634     The input parameters are in C->lhs[level] and are
00635         C->lhs[level][0]  TYPEALLLOOPS
00636         C->lhs[level][1]  6
00637         C->lhs[level][2]  Number of function v.
00638         C->lhs[level][3]  Number of the output function loop.
00639         C->lhs[level][4]  option1: the type of argument.
00640         C->lhs[level][5]  option2: 0,1: what to do if no loop.
00641     Eligible arguments must be of the type SYMBOL, VECTOR, INDEX or SNUMBER.
00642     They must all be of the same type, indicated by option1.
00643     Extra restriction: In a loop, each v can be visited at most once.
00644     If there is no loop at all, option2 determines whether the term
00645     remains unmodified, or is replaced by zero.
00646     Function v can be either a regular function or a tensor.
00647     To facilitate this we copy the relevant arguments into the workspace.

```
00854     return(0);
00855 }
00856
00857 /*
00858     #] AllLoops :
00859     #[ StartLoops :
00860
00861     Algorithm.
00862     1: have a list of vertices and objects that can be part of the loops.
00863     2: starting with the first element of arglist, look for the two
00864        vertices that contain this object. The first is vstart.
00865     3: At the second, look at all possible objects to continue from here.
00866     4: For each, find the vertex with its partner.
00867     5: if the partner vertex is vstart, we have a loop. --> 9.
00868     6: The partner vertex is not allowed to be a vertex that we passed
00869        in the current build-up of the loop.
00870     7: Put the object in loop and increase nloop.
00871     8: Now sum over all allowed objects in the partner vertex. --> 4.
00872
00873     9: Create the function loop with the arguments from loop,nloop.
00874    10: If a reverse cyclic permutation gives a smaller result, drop this
00875        solution and continue with the last summing over objects at a vertex.
00876    11: If not, output the result by adding the function loop
00877        to the term and call Generator(term,level)
00878
00879    12: when all possibilities with the first element of arglist have been
00880        exhausted, raise arglist and lower nargs by one. --> 2
00881    13: when nargs == 1, we can stop.
00882
00883     The inclusion of a new object when we sum over the possibilities at a
00884     vertex can best be done in a recursion, because we have no idea how
00885     many nested loops we would otherwise need. Of course the recursion can
00886     be emulated, but that makes the algorithm rather messy.
00887
00888     We have two routines: StartLoops and GenLoops.
00889     StartLoops takes care of the first argument (and the summing over who
00890     is the first argument), while GenLoops treats an additional vertex until
00891     a loop is closed. GenLoops also sends completed loops off toe Generator.

01534     #[ AllOnePI :
01535
01536     We assume a graph that has loops and is OnePI.
01537     This routine initializes the recursion that creates all onePI subgraphs.
01538
01539     Algorithm:
01540         a: have a routine that removes all bridges: RemoveBridges
01541         b: output an empty diagram.
01542         c: output the diagram itself
01543         d: cut a line, followed by removing all bridges.
01544         e: if the diagram still has lines, go to c, else go to the next line in d.
01545     In order to avoid factorial blowup, we need to prune the tree as fast as possible.
01546
01547     1: list of lines to be cut.
01548     2: once we have tried a line and removed its bridges, we do not have to
01549        try this line deeper in the tree, neither its bridges.
```

```
01550
01551
01552      1 2 3
01553         cut 1.                        x
01554             cut 2 -> bridge 3          x
01555         cut 2.                        x
01556             cut 3 -> bridge 1   ????   mag niet
01557         cut 3.                        x
01558     Hence  1,2,3,4,5,6,7
01559         1 still to go 2,3,4,5,6,7
01560         2 still to go 3,4,5,6,7
01561         3 still to go 4,5,6,7
01562         etc.
01563     bridges: if x is bridge, we take x from the list_to_go.
01564     If we have a bridge that is a number lower than the list_to_go we skip this possibility.
01565     We reach the end when the list_to_go is empty.

00039
00040 The enhanced malloc debugger. It intercepts access (both write AND
00041 read) to the memory outside the allocated chunk in the following
00042 manner: it prints out (to the stderr) the information about the event
00043 and goes to the spilock. The user is able to attach the debugger to
00044 the running process, investigate the problem and continue evaluation.
00045
00046 In case of error, the debugger will print to the stderr the following
00047 information:
00048 "***** PID: ###, Addr: ###, signal ### (code ###)"
00049 "Attach gdb -p ### and set var loopForever=0 in a corresponding frame to continue"
00050 or for TFORM:
00051 "Attach gdb -p ### and set var loopForever=0 in a corresponding frame
00052    of a thread with LPW id ### to continue"
00053
00054 and go to the spilock. The user may attach gdb by the command
00055 gdb -p ### and type "where" (in case of TFORM, the user should first
00056 switch to the proper thread).  Then investigation of the corresponding
00057 frames should clarify the situation. In order to continue the program,
00058 the user might set (in the corresponding frame of the corresponding
00059 thread) the variable loopForever to 0. The debugger will try to remove
00060 local problem lead to the exception.
00061
00062 To activate the debugger, the macro MALLOCPROTECT should be
00063 defined. There are three possible values:
00064 #define MALLOCPROTECT -1 (any integer <0)
00065 #define MALLOCPROTECT 0
00066 #define MALLOCPROTECT 1 (any integer>0)
00067
00068 If MALLOCPROTECT < 0, the debugger will intercept any access to the
00069 memory before the allocated chunk, even one byte.
00070
00071 If MALLOCPROTECT == 0, the debugger will intercept any access to the
00072 memory before the allocated chunk, even one byte, and access to the
00073 memory page next to the allocated one.
00074
00075 If MALLOCPROTECT > 0, the debugger will intercept any access to the
00076 memory after the allocated chunk, even one byte, and access to the
00077 memory page before the allocated one.
00078
00079 The original FORM malloc debugger is able to catch errors when the
00080 allocated memory is freed improper, or if some small portion OUT of
00081 the allocated chunk is written. This debugger is a complementary
00082 one. It permits to catch situation when some small portion of memory
00083 before or after the allocated chunk is written or even just read.
00084
00085 The idea is to protect the beginning or the end of the allocated chunk
00086 for any kind of access and install the SIGSEGV handler in order to
00087 intercept the access to this memory. Moreover, the allocated memory is
00088 always immediately returned to the system so if the user tries to
00089 access the memory after it is freed then the handler is triggered,
00090 also.
00091
00092 The problem here is that we are able to allocate / protect only the
00093 whole page. So the user has to run the debugger twice: one time with
00094 the left alignment (#define MALLOCPROTECT <0), and then with the right
00095 alignment (#define MALLOCPROTECT >0). During the first run the possible
00096 errors like x[-1] will be caught, and the second run will manifest
00097 reading over the allocated ares.
00098
00099 The leftmost extra page is always allocated and protected. The size
00100 of the allocated chunk is stored in the beginning of this page.

4.71.1 Detailed Description

Contains the routines that write messages. This includes the very important routine MesPrint which is the FORM equivalent of printf but then with escape sequences that are relevant for symbolic manipulation. The FORM statement Print "...." is passed almost literally to MesPrint.

Definition in file message.c.

4.71.2 Function Documentation

4.71.2.1 Error0()

```
NORETURN void Error0 (
            char * s )
```

Definition at line 56 of file message.c.

4.71.2.2 Error1()

```
NORETURN void Error1 (
            char * s,
            UBYTE * t )
```

Definition at line 67 of file message.c.

4.71.2.3 Error2()

```
NORETURN void Error2 (
            char * s1,
            char * s2,
            UBYTE * t )
```

Definition at line 78 of file message.c.

4.71.2.4 MesWork()

```
NORETURN void MesWork (
            void  )
```

Definition at line 89 of file message.c.

4.71.2.5 MesPrint()

```
int MesPrint (
            const char * fmt,
             ...  )
```

Definition at line 136 of file message.c.

4.71.2.6 Warning()

```
void Warning (
            char * s )
```

Definition at line 794 of file message.c.

4.71.2.7 HighWarning()

```
void HighWarning (
            char * s )
```

Definition at line 806 of file message.c.

4.71.2.8 MesCall()

```
int MesCall (
            char * s )
```

Definition at line 818 of file message.c.

4.71.2.9 MesCerr()

```
int MesCerr (
            char * s,
            UBYTE * t )
```

Definition at line 828 of file message.c.

4.71.2.10 MesComp()

```
int MesComp (
            char * s,
            UBYTE * p,
            UBYTE * q )

00100     Kind of a printf function for simple messages.
00101     The main concern is getting the arguments in a portable way.
00102     Note: many compilers have errors when sizeof(WORD) < sizeof(int)
00103     %a  array of size n WORDs (two parameters, first is int, second WORD *)
00104     %b  array of size n UBYTEs (two parameters, first is int, second UBYTE *)
00105     %C  array of size n chars (two parameters, first is int, second char *)
00106     %d  word;
00107     %l  long;
00108     %L  long long *;
00109     %s  string;
00110     %#i unsigned word filled
00111     %#d word positioned
00112     %#l long word positioned.
00113     %#L long long word * positioned.
00114     %#s string positioned.
00115     %#p position in file.
00116     %r  The current term in raw format (internal representation)
00117     %t  The current term (AN.currentTerm)
```

```
00118     %T  The current term (AN.currentTerm) with its sign
00119     %w  Number of the thread(worker)
00120     %$  The next $ in AN.listinprint
00121     %x  hexadecimal. Takes 8 places. Mainly for debugging.
00122     %%  %
00123     %#  #
00124     #   " ==> "
00125     @   " ==> "   Preprocessor error
00126     &   ' --> '   Regular compiler error
00127     !>  ' ~~> '   Internal error
00128     Each call is terminated with a new line.
00129     Put a % at the end of the string to suppress the new line.
00130
00131     New feature (7-dec-2011): The & will only work when we do not block it
00132     from the execution of the print statement because we need the & also for
00133     the tabulator in the print "" statement.
00134 */

4.73.1 Detailed Description

These are the low level functions for the database part of the tablebases. These routines have been copied (and then adapted) from the minos database program. This file goes together with minos.h

Definition in file minos.c.

4.73.2 Macro Definition Documentation

4.73.2.1 CFD

```
#define CFD(
                y,
                s,
                type,
                x,
                j )
```

Value:

```
    for(x=0,j=0;j<((int)sizeof(type));j++) \
    {x=(x<<8)+((*s++)&0x00FF);} y=x;
```

Definition at line 55 of file minos.c.

4.73.2.2 CTD

```
#define CTD(
                y,
                s,
                type,
                x,
                j )
```

Value:

```
                    x=y;for(j=sizeof(type)-1;j>=0;j--){s[j]=x&0xFF; \
                    x>>=8;} s += sizeof(type);
```

Definition at line 57 of file minos.c.

4.73.3 Function Documentation

4.73.3.1 minosread()

```
int minosread (
              FILE * f,
              char * buffer,
              MLONG size )
```

Definition at line 66 of file minos.c.

4.73.3.2 minoswrite()

```
int minoswrite (
            FILE * f,
            char * buffer,
            MLONG size )
```

Definition at line 83 of file minos.c.

4.73.3.3 str_dup()

```
char * str_dup (
            char * str )
```

Definition at line 101 of file minos.c.

4.73.3.4 convertblock()

```
void convertblock (
            INDEXBLOCK * in,
            INDEXBLOCK * out,
            int mode )
```

Definition at line 120 of file minos.c.

4.73.3.5 convertnamesblock()

```
void convertnamesblock (
            NAMESBLOCK * in,
            NAMESBLOCK * out,
            int mode )
```

Definition at line 171 of file minos.c.

4.73.3.6 convertiniinfo()

```
void convertiniinfo (
            INIINFO * in,
            INIINFO * out,
            int mode )
```

Definition at line 197 of file minos.c.

4.73.3.7 LocateBase()

```
FILE * LocateBase (
            char ** name,
            char ** newname,
            char * iomode )
```

Definition at line 225 of file minos.c.

4.73.3.8 ReadIndex()

```
int ReadIndex (
            DBASE * d )
```

Definition at line 288 of file minos.c.

4.73.3.9 WriteIndexBlock()

```
int WriteIndexBlock (
            DBASE * d,
            MLONG num )
```

Definition at line 409 of file minos.c.

4.73.3.10 WriteNamesBlock()

```
int WriteNamesBlock (
            DBASE * d,
            MLONG num )
```

Definition at line 434 of file minos.c.

4.73.3.11 WriteIndex()

```
int WriteIndex (
            DBASE * d )
```

Definition at line 461 of file minos.c.

4.73.3.12 WriteIniInfo()

```
int WriteIniInfo (
            DBASE * d )
```

Definition at line 532 of file minos.c.

4.73.3.13 ReadIniInfo()

```
int ReadIniInfo (
            DBASE * d )
```

Definition at line 551 of file minos.c.

4.73.3.14 GetDbase()

```
DBASE * GetDbase (
            char * filename,
            MLONG rwmode )
```

Definition at line 578 of file minos.c.

4.73.3.15 NewDbase()

```
DBASE * NewDbase (
            char * name,
            MLONG number )
```

Definition at line 634 of file minos.c.

4.73.3.16 FreeTableBase()

```
void FreeTableBase (
            DBASE * d )
```

Definition at line 781 of file minos.c.

4.73.3.17 ComposeTableNames()

```
int ComposeTableNames (
            DBASE * d )
```

Definition at line 813 of file minos.c.

4.73.3.18 OpenDbase()

```
DBASE * OpenDbase (
            char * filename )
```

Definition at line 862 of file minos.c.

4.73.3.19 AddTableName()

```
MLONG AddTableName (
            DBASE * d,
            char * name,
            TABLES T )
```

Definition at line 896 of file minos.c.

4.73.3.20 GetTableName()

```
MLONG GetTableName (
            DBASE * d,
            char * name )
```

Definition at line 979 of file minos.c.

4.73.3.21 PutTableNames()

```
int PutTableNames (
            DBASE * d )
```

Definition at line 1011 of file minos.c.

4.73.3.22 AddToIndex()

```
int AddToIndex (
            DBASE * d,
            MLONG number )
```

Definition at line 1109 of file minos.c.

4.73.3.23 AddObject()

```
MLONG AddObject (
            DBASE * d,
            MLONG tablenumber,
            char * arguments,
            char * rhs )
```

Definition at line 1204 of file minos.c.

4.73.3.24 FindTableNumber()

```
MLONG FindTableNumber (
            DBASE * d,
            char * name )
```

Definition at line 1218 of file minos.c.

4.73.3.25 WriteObject()

```
int WriteObject (
            DBASE * d,
            MLONG tablenumber,
            char * arguments,
            char * rhs,
            MLONG number )
```

Definition at line 1246 of file minos.c.

4.73.3.26 ReadObject()

```
char * ReadObject (
             DBASE * d,
             MLONG tablenumber,
             char * arguments )
```

Definition at line 1350 of file minos.c.

4.73.3.27 ReadijObject()

```
char * ReadijObject (
             DBASE * d,
             MLONG i,
             MLONG j,
             char * arguments )
```

Definition at line 1435 of file minos.c.

4.73.3.28 ExistsObject()

```
int ExistsObject (
             DBASE * d,
             MLONG tablenumber,
             char * arguments )
```

Definition at line 1491 of file minos.c.

4.73.3.29 DeleteObject()

```
int DeleteObject (
             DBASE * d,
             MLONG tablenumber,
             char * arguments )
```

Definition at line 1523 of file minos.c.

4.75.1 Detailed Description

Contains all needed declarations and definitions for the tablebase low level file routines. These have been taken from the minos database system and modified somewhat.

!!!CAUTION!!! Changes in this file will most likely have consequences for the recovery mechanism (see checkpoint.c). You need to care for the code in checkpoint.c as well and modify the code there accordingly!

00031 /*
00032     #[ Explanations :
```

```
00033
00034     This is a second generation much simplified version of model.c
00035     Syntax:
00036         Model QED;
00037             Particle electron,positron,-2;
00038             Particle photon,+3;
00039             Vertex electron,positron,photon: g;
00040         EndModel;
00041     or:
00042         Model QCD;
00043             Particle quark,antiquark,-2;
00044             Particle ghost,antighost,-1;
00045             Particle gluon,+3;
00046             Vertex quark,antiquark,gluon: g;
00047             Vertex ghost,antighost,gluon: g;
00048             Vertex gluon,gluon,gluon: g;
00049             Vertex gluon,gluon,gluon,gluon: g^2;
00050         EndModel;
00051     Remarks:
00052     1: if no second particle is given, a particle and its antiparticle are the same
00053     2: Spin statistics is by dimension of SU(2) representation with a sign.
00054     3: In a vertex we need to mention the coupling constants.
00055     4: Internally a particle gives a vertex with only two lines.
00056     5: All particles must have been declared before any vertex.
00057
00058     The diagrams should be provided as a collection of nodes and edges
00059     with momenta with a direction substituted. The other parameters (like
00060     Lorentz indices, color indices etc.) can then be provided in a procedure
00061     that should go with this mode definition.
00062     In principle the edges are not needed if there are no 'insertions', but
00063     because we would like to have the insertions as well we need the edges.

4.79.1 Detailed Description

A number of routines that deal with the moduleoption statement and the execution of modules. Additionally there are the execution of the exec and pipe instructions.

Definition in file module.c.

4.79.2 Function Documentation

4.79.2.1 ModuleInstruction()

```
int ModuleInstruction (
            int * moduletype,
            int * specialtype )
```

Definition at line 76 of file module.c.

4.79.2.2 CoModuleOption()

```
int CoModuleOption (
            UBYTE * s )
```

Definition at line 143 of file module.c.

4.79.2.3 CoModOption()

```
int CoModOption (
            UBYTE * s )
```

Definition at line 213 of file module.c.

4.79.2.4 SetSpecialMode()

```
void SetSpecialMode (
            int moduletype,
            int specialtype )
```

Definition at line 258 of file module.c.

4.79.2.5 ExecModule()

```
int ExecModule (
            int moduletype )
```

Definition at line 275 of file module.c.

4.79.2.6 ExecStore()

```
int ExecStore (
            void  )
```

Definition at line 300 of file module.c.

4.79.2.7 FullCleanUp()

```
void FullCleanUp (
            void  )
```

Definition at line 315 of file module.c.

4.79.2.8 DoPolyfun()

```
int DoPolyfun (
            UBYTE * s )
```

Definition at line 398 of file module.c.

4.79.2.9 DoPolyratfun()

```
int DoPolyratfun (
            UBYTE * s )
```

Definition at line 461 of file module.c.

4.79.2.10 DoNoParallel()

```
int DoNoParallel (
            UBYTE * s )
```

Definition at line 532 of file module.c.

4.79.2.11 DoParallel()

```
int DoParallel (
            UBYTE * s )
```

Definition at line 547 of file module.c.

4.79.2.12 DoModSum()

```
int DoModSum (
            UBYTE * s )
```

Definition at line 562 of file module.c.

4.79.2.13 DoModMax()

```
int DoModMax (
            UBYTE * s )
```

Definition at line 582 of file module.c.

4.79.2.14 DoModMin()

```
int DoModMin (
            UBYTE * s )
```

Definition at line 602 of file module.c.

4.79.2.15 DoModLocal()

```
int DoModLocal (
            UBYTE * s )
```

Definition at line 622 of file module.c.

4.79.2.16 DoProcessBucket()

```
int DoProcessBucket (
            UBYTE * s )
```

Definition at line 642 of file module.c.

4.79.2.17 DoModDollar()

```
UBYTE * DoModDollar (
            UBYTE * s,
            int type )
```

Definition at line 660 of file module.c.

4.79.2.18 DoinParallel()

```
int DoinParallel (
            UBYTE * s )
```

Definition at line 775 of file module.c.

4.79.2.19 DonotinParallel()

```
int DonotinParallel (
            UBYTE * s )
```

Definition at line 785 of file module.c.

4.79.2.20 DoExecStatement()

```
int DoExecStatement (
            void  )
```

Definition at line 797 of file module.c.

4.79.2.21 DoPipeStatement()

```
int DoPipeStatement (
            void  )
```

Definition at line 814 of file module.c.

4.81.1 Detailed Description

MPI dependent functions of parform

This file contains all the functions for the parallel version of form3 that explicitly need to call mpi routines. This is the only file that really needs to be linked to the mpi-library!

Definition in file mpi.c.

4.81.2 Macro Definition Documentation

4.81.2.1 PF_PACKSIZE

```
#define PF_PACKSIZE 1600
```

Definition at line 63 of file mpi.c.

4.81.2.2 MPI_ERRCODE_CHECK

```
#define MPI_ERRCODE_CHECK(
              err )
```

Value:

```
do { \
    int _tmp_err = (err); \
    if ( _tmp_err != MPI_SUCCESS ) return _tmp_err != 0 ? _tmp_err : -1; \
} while (0)
```

A macro which exits the caller with a non-zero return value if *err* is not MPI_SUCCESS.

Parameters

err	The return value of a MPI function to be checked.

Remarks

The MPI standard defines MPI_SUCCESS == 0. Then (_tmp_err == 0) appears twice and we can expect the second evaluation will be eliminated by the compiler optimization.

Definition at line 89 of file mpi.c.

4.81.3 Function Documentation

4.81.3.1 PF_RealTime()

```
LONG PF_RealTime (
            int i )
```

Returns the realtime in 1/100 sec. as a LONG.

Parameters

i	the timer will be reset if i == 0.

Returns

the real elapsed time in 1/100 second.

Definition at line 106 of file mpi.c.

Referenced by PF_Init().

4.81.3.2 PF_LibInit()

```
int PF_LibInit (
            int * argcp,
            char *** argvp )
```

Performs all library dependent initializations.

Parameters

argcp	pointer to the number of arguments.
argvp	pointer to the arguments.

Returns

0 if OK, nonzero on error.

Definition at line 128 of file mpi.c.

Referenced by PF_Init().

4.81.3.3 PF_LibTerminate()

```
int PF_LibTerminate (
            int error )
```

Exits mpi, when there is an error either indicated or happening, returnvalue is 1, else returnvalue is 0.

Parameters

error	an error code.

Returns

0 if OK, nonzero on error.

Definition at line 214 of file mpi.c.

Referenced by PF_Terminate().

4.81.3.4 PF_Probe()

```
int PF_Probe (
            int * src )
```

Probes the next incoming message. If src == PF_ANY_SOURCE this operation is blocking, otherwise nonblocking.

Parameters

in,out	*src*	the source process number. In output, the process number of actual found source.

Returns

the tag value of the next incoming message if found, 0 if a nonblocking probe (input src != PF_ANY_SOURCE) did not find any messages. A negative returned value indicates an error.

Definition at line 235 of file mpi.c.

4.81.3.5 PF_ISendSbuf()

```
int PF_ISendSbuf (
            int to,
            int tag )
```

Nonblocking send operation. It sends everything from `buff` to `fill` of the active buffer. Depending on *tag* it also can do waiting for other sends to finish or set the active buffer to the next one.

Parameters

to	the destination process number.
tag	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 266 of file mpi.c.

Referenced by FlushOut(), PF_Processor(), and PutOut().

4.81.3.6 PF_RecvWbuf()

```
int PF_RecvWbuf (
            WORD * b,
            LONG * s,
            int * src )
```

Blocking receive of a `WORD` buffer.

Parameters

`out`	*b*	the buffer to store the received data.
`in,out`	*s*	the size of the buffer. The output value is the actual size of the received data.
`in,out`	*src*	the source process number. The output value is the process number of actual source.

Returns

the received message tag. A negative value indicates an error.

Definition at line 342 of file mpi.c.

References PF_ReceiveRuntimeError().

Here is the call graph for this function:

4.81.3.7 PF_IRecvRbuf()

```
int PF_IRecvRbuf (
            PF_BUFFER * r,
            int bn,
            int from )
```

Posts nonblocking receive for the active receive buffer. The buffer is filled from `full` to `stop`.

Parameters

r	the PF_BUFFER struct for the nonblocking receive.
bn	the index of the cyclic buffer.
from	the source process number.

Returns

0 if OK, nonzero on error.

Definition at line 378 of file mpi.c.

4.81.3.8 PF_WaitRbuf()

```
int PF_WaitRbuf (
            PF_BUFFER * r,
            int bn,
            LONG * size )
```

Waits for the buffer *bn* to finish a pending nonblocking receive. It returns the received tag and in `*size` the number of field received. If the receive is already finished, just return the flag and size, else wait for it to finish, but also check for other pending receives.

Parameters

	r	the PF_BUFFER struct for the pending nonblocking receive.
	bn	the index of the cyclic buffer.
out	*size*	the actual size of received data.

Returns

the received message tag. A negative value indicates an error.

Definition at line 412 of file mpi.c.

4.81.3.9 PF_Bcast()

```
int PF_Bcast (
            void * buffer,
            int count )
```

Broadcasts a message from the master to slaves.

Parameters

in,out	*buffer*	the starting address of buffer. The contents in this buffer on the master will be transferred to those on the slaves.
	count	the length of the buffer in bytes.

Returns

0 if OK, nonzero on error.

Definition at line 452 of file mpi.c.

Referenced by PF_BroadcastBuffer(), and PF_BroadcastNumber().

4.81.3.10 PF_Reduce()

```
int PF_Reduce (
              const void * sendbuf,
              void * recvbuf,
              int count,
              MPI_Datatype type,
              MPI_Op op,
              int root )
```

Performs a reduce operation across all processes.

Parameters

in	*sendbuf*	the buffer containing the data to be reduced.
out	*recvbuf*	the buffer to store the reduced result (only for the root process).
	count	the number of elements in the buffers.
	type	the datatype of the elements.
	op	the operation to apply.
	root	the root process number.

Returns

0 if OK, nonzero on error.

Definition at line 475 of file mpi.c.

Referenced by PF_GetSlaveTimes().

4.81.3.11 PF_RawSend()

```
int PF_RawSend (
              int dest,
              void * buf,
              LONG l,
              int tag )
```

Sends *l* bytes from *buf* to *dest*. Returns 0 on success, or -1.

Parameters

dest	the destination process number.
buf	the send buffer.
l	the size of data in the send buffer in bytes.
tag	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 497 of file mpi.c.

Referenced by PF_MUnlock(), PF_ReceiveRuntimeError(), and PF_SendFile().

4.81.3.12 PF_RawRecv()

```
LONG PF_RawRecv (
            int * src,
            void * buf,
            LONG thesize,
            int * tag )
```

Receives not more than *thesize* bytes from *src*, returns the actual number of received bytes, or -1 on failure.

Parameters

in,out	*src*	the source process number. In output, that of the actual received message.
out	*buf*	the receive buffer.
	thesize	the size of the receive buffer in bytes.
out	*tag*	the message tag of the actual received message.

Returns

the actual sizeof received data in bytes, or -1 on failure.

Definition at line 518 of file mpi.c.

Referenced by PF_ReceiveRuntimeError(), and PF_RecvFile().

4.81.3.13 PF_RawProbe()

```
int PF_RawProbe (
            int * src,
            int * tag,
            int * bytesize )
```

Probes an incoming message.

Parameters

in,out	*src*	the source process number. In output, that of the actual received message.
in,out	*tag*	the message tag. In output, that of the actual received message.
out	*bytesize*	the size of incoming data in bytes.

Returns

0 if OK, nonzero on error.

Definition at line 542 of file mpi.c.

4.81.3.14 PF_RawIsend()

```
int PF_RawIsend (
            int dest,
            const void * buf,
            int count,
            MPI_Datatype type,
            int tag,
            MPI_Request * request )
```

Performs a nonblocking send.

Parameters

	dest	the destination process number.
in	*buf*	the send buffer.
	count	the number of elements in the send buffer.
	type	the datatype of the data in the send buffer.
	tag	the message tag.
out	*request*	the request handle for the nonblocking operation.

Returns

0 if OK, nonzero on error.

Definition at line 574 of file mpi.c.

4.81.3.15 PF_RawWaitAll()

```
int PF_RawWaitAll (
            int count,
            MPI_Request * request,
            MPI_Status * status )
```

Waits for all the given requests to complete.

Parameters

	count	the number of requests.
in,out	*request*	the array of request handles.
out	*status*	the array of status objects to store the status of each completed request.

Returns

0 if OK, nonzero on error.

Definition at line 594 of file mpi.c.

4.81.3.16 PF_Discard()

```
int PF_Discard (
            int * src,
            int * tag )
```

Discards an incoming message.

Parameters

in,out	*src*	the source process number. On output, that of the actual received message.
in,out	*tag*	the message tag. On output, that of the actual received message.

Returns

0 if OK, nonzero on error.

Definition at line 615 of file mpi.c.

4.81.3.17 PF_PrintPackBuf()

```
int PF_PrintPackBuf (
            char * s,
            int size )
```

Prints the contents in the pack buffer.

Parameters

s	a message to be shown.
size	the length of the buffer to be shown.

Returns

0 if OK, nonzero on error.

Definition at line 707 of file mpi.c.

4.81.3.18 PF_PreparePack()

```
int PF_PreparePack (
            void  )
```

Prepares for the next pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 736 of file mpi.c.

Referenced by Optimize(), PF_BroadcastPreDollar(), PF_BroadcastString(), and PF_Init().

4.81.3.19 PF_Pack()

```
int PF_Pack (
            const void * buffer,
            size_t count,
            MPI_Datatype type )
```

Adds data into the pack buffer.

Parameters

buffer	the pointer to the buffer storing the data to be packed.
count	the number of elements in the buffer.
type	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 754 of file mpi.c.

References MPI_ERRCODE_CHECK.

Referenced by Optimize(), PF_BroadcastPreDollar(), and PF_Init().

4.81.3.20 PF_Unpack()

```
int PF_Unpack (
            void * buffer,
            size_t count,
            MPI_Datatype type )
```

Retrieves the next data in the pack buffer.

Parameters

out	*buffer*	the pointer to the buffer to store the unpacked data.
	count	the number of elements of data to be received.
	type	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 783 of file mpi.c.

References MPI_ERRCODE_CHECK.

Referenced by Optimize(), PF_BroadcastPreDollar(), and PF_Init().

4.81.3.21 PF_PackString()

```
int PF_PackString (
            const UBYTE * str )
```

Packs a string *str* into the packed buffer PF_packbuf, including the trailing zero.

The first element (PF_INT) is the length of the packed portion of the string. If the string does not fit to the buffer PF_packbuf, the function packs only the initial portion. It returns the number of packed bytes, so if (str[length-1]=='\0') then the whole string fits to the buffer, if not, then the rest (str+length) must be packed and send again. On error, the function returns the negative error code.

One exception: the string "\0!\0" is used as an image of the NULL, so all 3 characters will be packed.

Parameters

str	a string to be packed.

Returns

the number of packed bytes, or a negative value on failure.

Definition at line 818 of file mpi.c.

Referenced by PF_BroadcastString().

4.81.3.22 PF_UnpackString()

```
int PF_UnpackString (
            UBYTE * str )
```

Unpacks a string to *str* from the packed buffer PF_packbuf, including the trailing zero.

It returns the number of unpacked bytes, so if (str[length-1]=='\0') then the whole string was unpacked, if not, then the rest must be appended to (str+length). On error, the function returns the negative error code.

Parameters

out	*str*	the buffer to store the unpacked string

Returns

the number of unpacked bytes, or a negative value on failure.

Definition at line 886 of file mpi.c.

Referenced by PF_BroadcastString().

4.81.3.23 PF_Send()

```
int PF_Send (
              int to,
              int tag )
```

Sends the contents in the pack buffer to the process specified by *to*.

Example:

```
if ( PF.me == SRC ) {
  PF_PreparePack();
  // Packing operations here...
  PF_Send(DEST, TAG);
}
else if ( PF.me == DEST ) {
  PF_Receive(SRC, TAG, &actual_src, &actual_tag);
  // Unpacking operations here...
}
```

Parameters

to	the destination process number.
tag	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 933 of file mpi.c.

References MPI_ERRCODE_CHECK.

4.81.3.24 PF_Receive()

```
int PF_Receive (
              int src,
              int tag,
              int * psrc,
              int * ptag )
```

Receives data into the pack buffer from the process specified by *src*. This function allows &src == psrc or &tag == ptag. Either *psrc* or *ptag* can be NULL.

See the example of PF_Send().

Parameters

	src	the source process number (can be PF_ANY_SOURCE).
	tag	the source message tag (can be PF_ANY_TAG).
out	*psrc*	the actual source process number of received message.
out	*ptag*	the received message tag.

Returns

0 if OK, nonzero on error.

Definition at line 959 of file mpi.c.

References MPI_ERRCODE_CHECK.

4.81.3.25 PF_Broadcast()

```
int PF_Broadcast (
            void  )
```

Broadcasts the contents in the pack buffer on the master to those on the slaves.

Example:

```
if ( PF.me == MASTER ) {
  PF_PreparePack();
  // Packing operations here...
}
PF_Broadcast();
if ( PF.me != MASTER ) {
  // Unpacking operations here...
}
```

Returns

0 if OK, nonzero on error.

Definition at line 994 of file mpi.c.

References MPI_ERRCODE_CHECK.

Referenced by Optimize(), PF_BroadcastPreDollar(), PF_BroadcastString(), and PF_Init().

4.81.3.26 PF_PrepareLongSinglePack()

```
int PF_PrepareLongSinglePack (
            void  )
```

Prepares for the next long-single-pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 1561 of file mpi.c.

Referenced by PF_CollectModifiedDollars(), and PF_Processor().

4.81.3.27 PF_LongSinglePack()

```
int PF_LongSinglePack (
            const void * buffer,
            size_t count,
            MPI_Datatype type )
```

Adds data into the "long single" pack buffer.

Parameters

buffer	the pointer to the buffer storing the data to be packed.
count	the number of elements in the buffer.
type	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 1579 of file mpi.c.

Referenced by PF_CollectModifiedDollars(), and PF_Processor().

4.81.3.28 PF_LongSingleUnpack()

```
int PF_LongSingleUnpack (
            void * buffer,
            size_t count,
            MPI_Datatype type )
```

Retrieves the next data in the "long single" pack buffer.

Parameters

out	*buffer*	the pointer to the buffer to store the unpacked data.
	count	the number of elements of data to be received.
	type	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 1613 of file mpi.c.

Referenced by PF_CollectModifiedDollars(), and PF_Processor().

4.81.3.29 PF_LongSingleSend()

```
int PF_LongSingleSend (
            int to,
            int tag )
```

Sends the contents in the "long single" pack buffer to the process specified by *to*.

Example:

```
if ( PF.me == SRC ) {
  PF_PrepareLongSinglePack();
  // Packing operations here...
  PF_LongSingleSend(DEST, TAG);
}
else if ( PF.me == DEST ) {
  PF_LongSingleReceive(SRC, TAG, &actual_src, &actual_tag);
  // Unpacking operations here...
}
```

Parameters

to	the destination process number.
tag	the message tag.

Returns

0 if OK, nonzero on error.

Definition at line 1650 of file mpi.c.

Referenced by PF_CollectModifiedDollars(), and PF_Processor().

4.81.3.30 PF_LongSingleReceive()

```
int PF_LongSingleReceive (
            int src,
            int tag,
            int * psrc,
            int * ptag )
```

Receives data into the "long single" pack buffer from the process specified by *src*. This function allows &src == psrc or &tag == ptag. Either *psrc* or *ptag* can be NULL.

See the example of PF_LongSingleSend().

Parameters

	src	the source process number (can be PF_ANY_SOURCE).
	tag	the source message tag (can be PF_ANY_TAG).
out	*psrc*	the actual source process number of received message.
out	*ptag*	the received message tag.

Returns

0 if OK, nonzero on error.

Definition at line 1693 of file mpi.c.

Referenced by PF_CollectModifiedDollars(), and PF_Processor().

4.81.3.31 PF_PrepareLongMultiPack()

```
int PF_PrepareLongMultiPack (
            void  )
```

Prepares for the next long-multi-pack operations on the sender.

Returns

0 if OK, nonzero on error.

Definition at line 1752 of file mpi.c.

Referenced by Optimize(), PF_BroadcastCBuf(), PF_BroadcastExpFlags(), PF_BroadcastModifiedDollars(), and PF_BroadcastRedefinedPreVars().

4.81.3.32 PF_LongMultiPackImpl()

```
int PF_LongMultiPackImpl (
            const void * buffer,
            size_t count,
            size_t eSize,
            MPI_Datatype type )
```

Adds data into the "long multi" pack buffer.

Parameters

buffer	the pointer to the buffer storing the data to be packed.
count	the number of elements in the buffer.
eSize	the byte size of each element of data.
type	the data type of elements in the buffer.

Returns

0 if OK, nonzero on error.

Definition at line 1771 of file mpi.c.

References PF_LongMultiPackImpl().

Referenced by PF_LongMultiPackImpl().

Here is the call graph for this function:

4.81.3.33 PF_LongMultiUnpackImpl()

```
int PF_LongMultiUnpackImpl (
            void * buffer,
            size_t count,
            size_t eSize,
            MPI_Datatype type )
```

Retrieves the next data in the "long multi" pack buffer.

Parameters

out	*buffer*	the pointer to the buffer to store the unpacked data.
	count	the number of elements of data to be received.
	eSize	the byte size of each element of data.
	type	the data type of elements of data to be received.

Returns

0 if OK, nonzero on error.

Definition at line 1830 of file mpi.c.

References PF_LongMultiUnpackImpl().

Referenced by PF_LongMultiUnpackImpl().

Here is the call graph for this function:

4.81.3.34 PF_LongMultiBroadcast()

```
int PF_LongMultiBroadcast (
              void  )
```

Broadcasts the contents in the "long multi" pack buffer on the master to those on the slaves.

Example:

```
if ( PF.me == MASTER ) {
  PF_PrepareLongMultiPack();
  // Packing operations here...
}
PF_LongMultiBroadcast();
if ( PF.me != MASTER ) {
  // Unpacking operations here...
}
```

Returns

0 if OK, nonzero on error.

Definition at line 1916 of file mpi.c.

Referenced by Optimize(), PF_BroadcastCBuf(), PF_BroadcastExpFlags(), PF_BroadcastModifiedDollars(), and PF_BroadcastRedefinedPreVars().

01022         #] PF_Broadcast :
01023     #] The pack buffer :
01024     #[ Long pack stuff :
01025         #[ Explanations :
01026 
01027     The problems here are:
01028         1. We need to send/receive long dollar variables. For
01029     preprocessor-defined dollarvars we used multiply
01030     packing/broadcasting  (see parallel.c:PF_BroadcastPreDollar())
01031     since each variable must be broadcast immediately. For run-time
01032     the changed dollar variables, collecting and broadcasting are
01033     performed at the end of the module and all modified dollarvars
01034     are transferred "at once", that is why the size of packed and
01035     transferred buffers may be really very large.
01036         2. There is some strange feature of MPI_Bcast() on Altix MPI
01037     implementation, namely, sometimes it silently fails with big
01038     buffers. For better performance, it would be useful to send one
01039     big buffer instead of several small ones (since the latency is more
01040     important than the bandwidth). That is why we need two different
01041     sets of routines: for long point-to-point communication we collect
```

```
01042     big re-allocatable buffer, the corresponding routines have the
01043     prefix PF_longSingle, and for broadcasting we pack data into
01044     several smaller buffers, the corresponding routines have the
01045     prefix PF_longMulti.
01046         Note, from portability reasons we cannot split large packed
01047     buffer into small chunks, send them and collect back on the other
01048     side, see "Advice to users" on page 180 MPI--The Complete Reference
01049     Volume1, second edition.
01050         OPTIMIZING:
01051         We assume, for most communications, the single buffer of size
01052     PF_packsize is enough.
01053
01054         How does it work:
01055         For point-to-point, there is one big re-allocatable
01056     buffer PF_longPackBuf with two integer positions: PF_longPackPos
01057     and PF_longPackTop (due to re-allocatable character of the buffer,
01058     it is better to use integers rather than pointers).
01059         Each time of re-allocation, the size of the buffer
01060     PF_longPackBuf is incremented by the same size of a "standard" chunk
01061     PF_packsize.
01062         For broadcasting there is one linked list (PF_longMultiRoot),
01063     which contains either positions of a chunk of PF_longPackBuf, or
01064     it's own buffer. This is done for better memory utilisation:
01065     longSingle and longMulti are never used simultaneously.
01066         When a new cell is needed for LongMulti packing, we increment
01067     the counter PF_longPackN and just follow the list. If it is not
01068     possible, we allocate the cell's own buffer and link it to the end
01069     of the list PF_longMultiRoot.
01070         When PF_longPackPos is reallocated, we link new chunks into
01071     existing PF_longMultiRoot list before the first longMulti allocated
01072     cell's own buffer. The pointer PF_longMultiLastChunk points to the last
01073     cell of PF_longMultiRoot containing the pointer to the chunk of
01074     PF_longPackBuf.
01075         Initialization PF_longPackBuf is made by the function
01076     PF_longSingleReset(). In the begin of the PF_longPackBuf it packs
01077     the size of the last sent buffer. Upon sending, the program checks,
01078     whether there was at list one re-allocation (PF_longPackN>1) .
01079     If so, the sender first packs and sends small buffer
01080     (PF_longPackSmallBuf) containing one integer number -- the
01081     _negative_ new size of the send buffer. Getting the buffer, a
01082     receiver unpacks one integer and checks whether it is <0 . If so,
01083     the receiver will repeat receiving, but first it checks whether
01084     it has enough buffer and increase it, if necessary.
01085         Initialization PF_longMultiRoot is made by the function
01086     PF_longMultiReset(). In the begin of the first chunk it packs
01087     one integer -- the number 1. Upon sending, the program checks,
01088     how many cells were packed (PF_longPackN). If more than 1, the
01089     sender packs to the next cell the integer PF_longPackN, than
01090     packs PF_longPackN pairs of integers -- the information about how many
01091     times chunk on each cell was accessed by the packing procedure,
01092     this information is contained by the nPacks field of the cell
01093     structure, and how many non-complete items was at the end of this
01094     chunk the structure field lastLen. Then the sender sends first
01095     this auxiliary chunk.
01096     The receiver unpacks the integer from obtained chunk and, if this
01097     integer is more than 1, it gets more chunks, unpacking information
01098     from the first auxiliary chunk into the corresponding nPacks
01099     fields. Unpacking information from multiple chunks, the receiver
01100     knows, when the chunk is expired and it must switch to the next cell,
01101     successively decrementing corresponding nPacks field.
01102
01103     XXX: There are still some flaws:
01104     PF_LongSingleSend/PF_LongSingleReceive may fail, for example, for data
01105     transfers from the master to many slaves. Suppose that the master sends big
01106     data to slaves, which needs an increase of the buffer of the receivers. For
01107     the first data transfer, the master sends the new buffer size as the first
01108     message, and then sends the data as the second message, because
01109     PF_LongSinglePack records the increase of the buffer size on the master. For
01110     the next time, however, the master sends the data without sending the new
01111     buffer size, and then MPI_Recv fails due to the data overflow.
01112     In parallel.c, they are used for the communication from slaves to the
01113     master. In this case, this problem does not occur because the master always
01114     has enough buffer.
01115     The maximum size that PF_LongMultiBroadcast can broadcast is limited to
01116     around 320kB because the current implementation tries to pack all
01117     information of chained buffers into one buffer, whose size is PF_packsize
01118     = 1600B.

4.87.1 Detailed Description

The complete names administration. All variables with a name have to pass here to be properly registered, have structs of the proper type assigned to them etc. The file also contains the utility routines for maintaining the balanced trees that make searching for names rather fast.

Definition in file names.c.

4.87.2 Function Documentation

4.87.2.1 GetNode()

```
NAMENODE * GetNode (
              NAMETREE * nametree,
              UBYTE * name )
```

Definition at line 49 of file names.c.

4.87.2.2 AddName()

```
int AddName (
              NAMETREE * nametree,
              UBYTE * name,
              WORD type,
              WORD number,
              int * nodenum )
```

Definition at line 71 of file names.c.

4.87.2.3 GetName()

```
int GetName (
              NAMETREE * nametree,
              UBYTE * namein,
              WORD * number,
              int par )
```

Definition at line 254 of file names.c.

4.87.2.4 GetFunction()

```
UBYTE * GetFunction (
              UBYTE * s,
              WORD * funnum )
```

Definition at line 344 of file names.c.

4.87.2.5 GetNumber()

```
UBYTE * GetNumber (
             UBYTE * s,
             WORD * num )
```

Definition at line 390 of file names.c.

4.87.2.6 GetLastExprName()

```
int GetLastExprName (
             UBYTE * name,
             WORD * number )
```

Definition at line 440 of file names.c.

4.87.2.7 GetOName()

```
int GetOName (
             NAMETREE * nametree,
             UBYTE * name,
             WORD * number,
             int par )
```

Definition at line 462 of file names.c.

4.87.2.8 GetAutoName()

```
int GetAutoName (
             UBYTE * name,
             WORD * number )
```

Definition at line 481 of file names.c.

4.87.2.9 GetVar()

```
int GetVar (
             UBYTE * name,
             WORD * type,
             WORD * number,
             int wantedtype,
             int par )
```

Definition at line 526 of file names.c.

4.87.2.10 EntVar()

```
int EntVar (
            WORD type,
            UBYTE * name,
            WORD x,
            WORD y,
            WORD z,
            WORD d )
```

Definition at line 559 of file names.c.

4.87.2.11 GetDollar()

```
int GetDollar (
            UBYTE * name )
```

Definition at line 592 of file names.c.

4.87.2.12 DumpTree()

```
void DumpTree (
            NAMETREE * nametree )
```

Definition at line 604 of file names.c.

4.87.2.13 DumpNode()

```
void DumpNode (
            NAMETREE * nametree,
            WORD node,
            WORD depth )
```

Definition at line 617 of file names.c.

4.87.2.14 CompactifyTree()

```
int CompactifyTree (
            NAMETREE * nametree,
            WORD par )
```

Definition at line 636 of file names.c.

4.87.2.15 CopyTree()

```
void CopyTree (
            NAMETREE * newtree,
            NAMETREE * oldtree,
            WORD node,
            WORD par )
```

Definition at line 698 of file names.c.

4.87.2.16 LinkTree()

```
void LinkTree (
            NAMETREE * tree,
            WORD offset,
            WORD numnodes )
```

Definition at line 788 of file names.c.

4.87.2.17 MakeNameTree()

```
NAMETREE * MakeNameTree (
            void  )
```

Definition at line 819 of file names.c.

4.87.2.18 FreeNameTree()

```
void FreeNameTree (
            NAMETREE * n )
```

Definition at line 838 of file names.c.

4.87.2.19 ClearWildcardNames()

```
void ClearWildcardNames (
            void  )
```

Definition at line 853 of file names.c.

4.87.2.20 AddWildcardName()

```
int AddWildcardName (
            UBYTE * name )
```

Definition at line 858 of file names.c.

4.87.2.21 GetWildcardName()

```
int GetWildcardName (
            UBYTE * name )
```

Definition at line 902 of file names.c.

4.87.2.22 AddSymbol()

```
int AddSymbol (
             UBYTE * name,
             int minpow,
             int maxpow,
             int cplx,
             int dim )
```

Definition at line 924 of file names.c.

4.87.2.23 CoSymbol()

```
int CoSymbol (
             UBYTE * s )
```

Definition at line 950 of file names.c.

4.87.2.24 AddIndex()

```
int AddIndex (
             UBYTE * name,
             int dim,
             int dim4 )

01634
01635 /*
01636     #] CoFunction + ...:
01637     #[ DoTable :
01638
01639         Syntax:
01640         Table [check] [strict|relax] [zerofill] name(:1:2,...,regular arguments);
01641         name must be the name of a regular function.
01642         the table indices must be the first arguments.
01643         The parenthesis indicates 'name' as opposed to the options.
01644
01645         We leave behind:
01646         a struct tabl in the FUNCTION struct
01647         Regular table:
01648             an array tablepointers for the pointers to elements of rhs
```

```
01649             in the compiler struct cbuf[T->bufnum]
01650             an array MINMAX T->mm with the minima and maxima
01651             a prototype array
01652             an offset in the compiler buffer for the pattern to be matched
01653         Sparse table:
01654             Just the number of dimensions
01655             We will keep track of the number of defined elements in totind
01656             and in tablepointers we will have numind+1 positions for each
01657             element. The first numind elements for the indices and the
01658             last one for the element in cbuf[T->bufnum].rhs
01659 
01660             If the number of dimensions is *<number>, there is not a fixed
01661             number of dimensions. Just a maximum. In that case the first
01662             index should be the number of other dimensions. This first index
01663             does not count in <number>.
01664 
01665         Complication: to preserve speed we need a prototype and a pattern
01666         for each thread when we use WITHPTHREADS. This is because we write
01667         into those when looking for the pattern.

4.89.1 Detailed Description

Mainly the routine Normalize. This routine brings terms to standard form. Its main buffers are in AT, but they have a fixed size controlled by NORMSIZE, which limit the maximum complexity of terms which can be normalized.

Normalize is called recursively, currently via: Normalize -> ExpandRat -> Normalize.

4.89.3.5 DoTheta()

```
int DoTheta (
            PHEAD WORD * t )
```

Definition at line 4324 of file normal.c.

4.89.3.6 DoDelta()

```
int DoDelta (
            WORD * t )
```

Definition at line 4421 of file normal.c.

4.89.3.7 DoRevert()

```
void DoRevert (
             WORD * fun,
             WORD * tmp )
```

Definition at line 4488 of file normal.c.

4.89.3.8 DetCommu()

```
WORD DetCommu (
             WORD * terms )
```

Definition at line 4576 of file normal.c.

4.89.3.9 DoesCommu()

```
WORD DoesCommu (
             WORD * term )
```

Definition at line 4635 of file normal.c.

4.89.3.10 TreatPolyRatFun()

```
int TreatPolyRatFun (
             PHEAD WORD * prf )
```

Definition at line 5026 of file normal.c.

4.89.3.11 DropCoefficient()

```
void DropCoefficient (
             PHEAD WORD * term )
```

Definition at line 5162 of file normal.c.

4.89.3.12 DropSymbols()

```
void DropSymbols (
             PHEAD WORD * term )
```

Definition at line 5180 of file normal.c.

4.89.3.13 SymbolNormalize()

```
int SymbolNormalize (
            WORD * term )
```

Routine normalizes terms that contain only symbols. Regular minimum and maximum properties are ignored.

We check whether there are negative powers in the output. This is not allowed.
